Position Available: Ph.D. Candidate

Comprehensive Security Assurance Solutions for Software-Dependent Systems

The Cyber Security Evaluation and Assurance (CyberSEA) Research Lab at Carleton University is actively looking for multiple graduate students at the Doctoral level to contribute to a funded research program developing Comprehensive Security Assurance Solutions for Software-Dependent Systems starting in September 2021.

Project Description

The overall aim of this research program is to establish comprehensive security assurance solutions by enhancing security-by-design approaches for engineering secure software-dependent systems. More specifically, it aims to develop more incremental, modular, and compositional solutions for securing systems from the outset and for generating sufficient evidence of their built-in resilience to a range of cyber-attacks and failures. This requires the integration of formal (mathematically rigorous) methods and security-by-design approaches to provide verifiable evidence to support security assurance claims from early stages of system development. We will achieve this by:

1. Developing formal modeling and analysis frameworks with which we can provide mathematical proofs of assurance of security properties of software-dependent systems at early stages of development;
2. Establishing system-level security evaluation methods and techniques for understanding and mitigating the risks to system assets posed by identified security vulnerabilities; and
3. Advancing techniques to support the management, evaluation, and presentation of sufficient evidence for developing incremental security assurance cases.

Projects related to the research program described above will be eligible for funding in the form of a research assistantship.

Duties and Responsibilities

As part of the Doctoral Program requirements, candidates will complete a dissertation on a topic aligned with the research mission of the CyberSEA Research Lab including but not limited to: cybersecurity evaluation and assurance, threat modeling, risk assessment and management, modelling and simulation for security, software engineering, distributed systems, and/or formal methods for security.

Desired Skills/Qualifications

Suitable candidates will have a Master’s degree in Software Engineering, Computer Science, or a related field. Ideal candidates will be self-motivated with an ability to work independently and to communicate effectively in a team environment. A background in logic and discrete mathematics, computer security, software/system modelling and software engineering processes and concepts is highly desirable. Experience with assurance/certification approaches and techniques, software maintenance and evolution, and reasoning is considered an asset.

All candidates must satisfy the Minimum Admission Requirements for Doctoral Programs at Carleton University.
Funding
Successful candidates for this position will be eligible for funding in the form of a research assistantship. Specific funding details are determined at the time of offer and consider numerous factors such as academic standing, research potential, availability of funds, eligibility for teaching assistantship and/or scholarships, etc.

Host Research Institute Information
Carleton University is a public comprehensive university, founded in 1942, in Ottawa, Ontario, Canada. The research-intensive Faculty of Engineering and Design at Carleton University is recognized as one of Canada’s leading institutions in the study and research of engineering, architecture, industrial design and information technology. Since the inception of engineering at Carleton in 1945, our experts have pushed the bounds of innovation and discovery. Carleton focuses on anticipating the needs of industry and society, and offers forward-thinking programs with real world application and produces research that is helping to shape our present and future. The Department of Systems and Computer Engineering is a recognized world-class institution in software engineering, computer systems engineering, communications engineering, and biomedical engineering. Together with the Department of Electronics, the Department of Systems and Computer Engineering constitutes one of the largest and most research-intensive centres for Electrical and Computer Engineering and Software Engineering education and research in Canada. The Cyber Security Evaluation and Assurance (CyberSEA) Research Lab conducts advanced academic research to develop systematic and rigorous approaches for evaluating and assuring the cyber security of software-dependent systems.
