# Modelling The Effect of Changing Weather Patterns on Farming Operations

## Databases and Logic

Dan MacDonald, Ruth Waldick, Sampsa Hamalainen – AAFC,  
Ottawa, Scott Mitchell, Anna Zaytseva – Carleton University  
Ottawa, Ontario, Tonia Tanner – Carleton University  
June 28, 2017

# The Question

- How do we look critically at what a change in weather patterns does to farms in an Agricultural Region?

- Crop specific = Corn, Soy, alfalfa
- Spatially explicit = varied weather across the region
- Operationally sensitive = individual farms, varied seeding dates, impacted by weather.

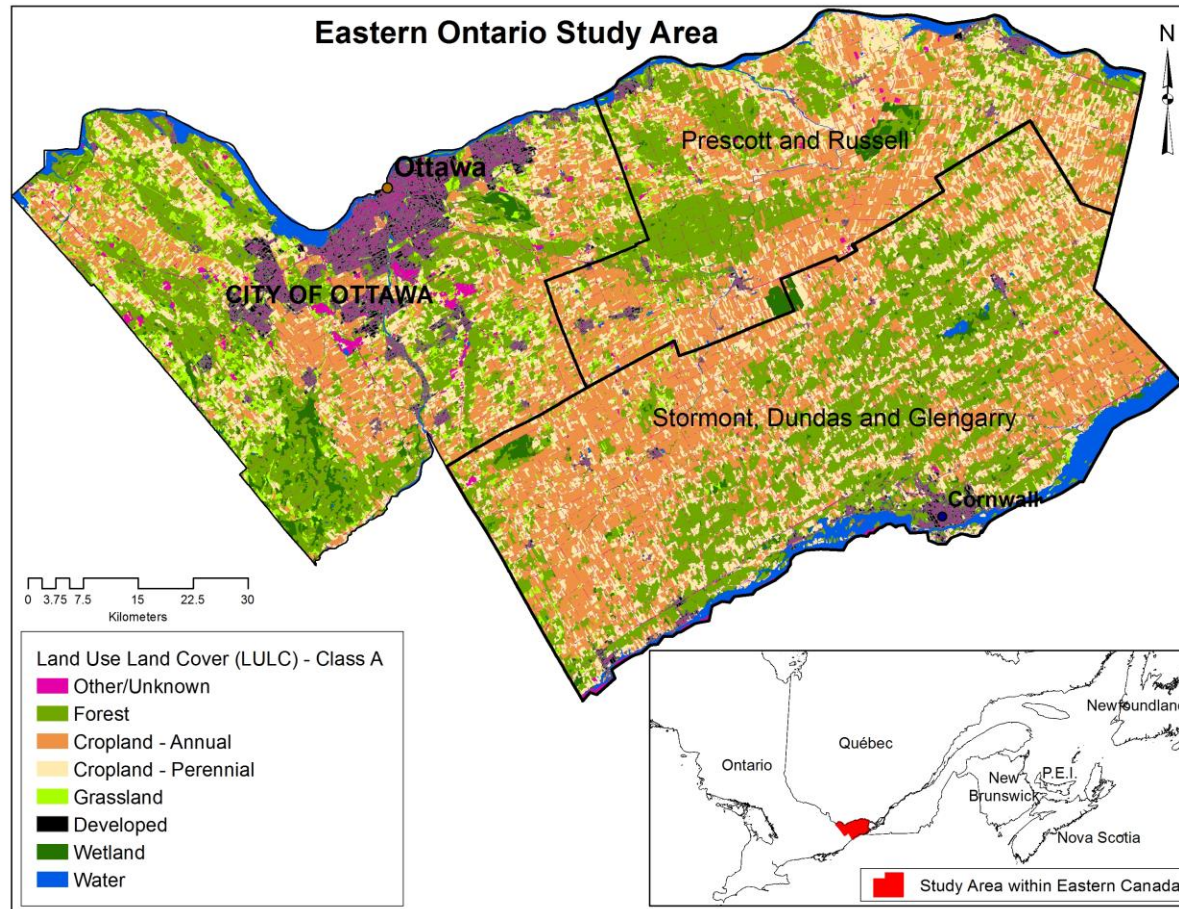

First day of the growing season!!

## Simulation model for Eastern Ontario

# Study Area

# Agricultural Systems in Eastern Ontario

- Agricultural operations are primarily dairy, field or cash crop, beef with some pig and poultry production.
- The principal crops are corn, soy, cereals and perennial hay.

# Envision Eastern Ontario Model

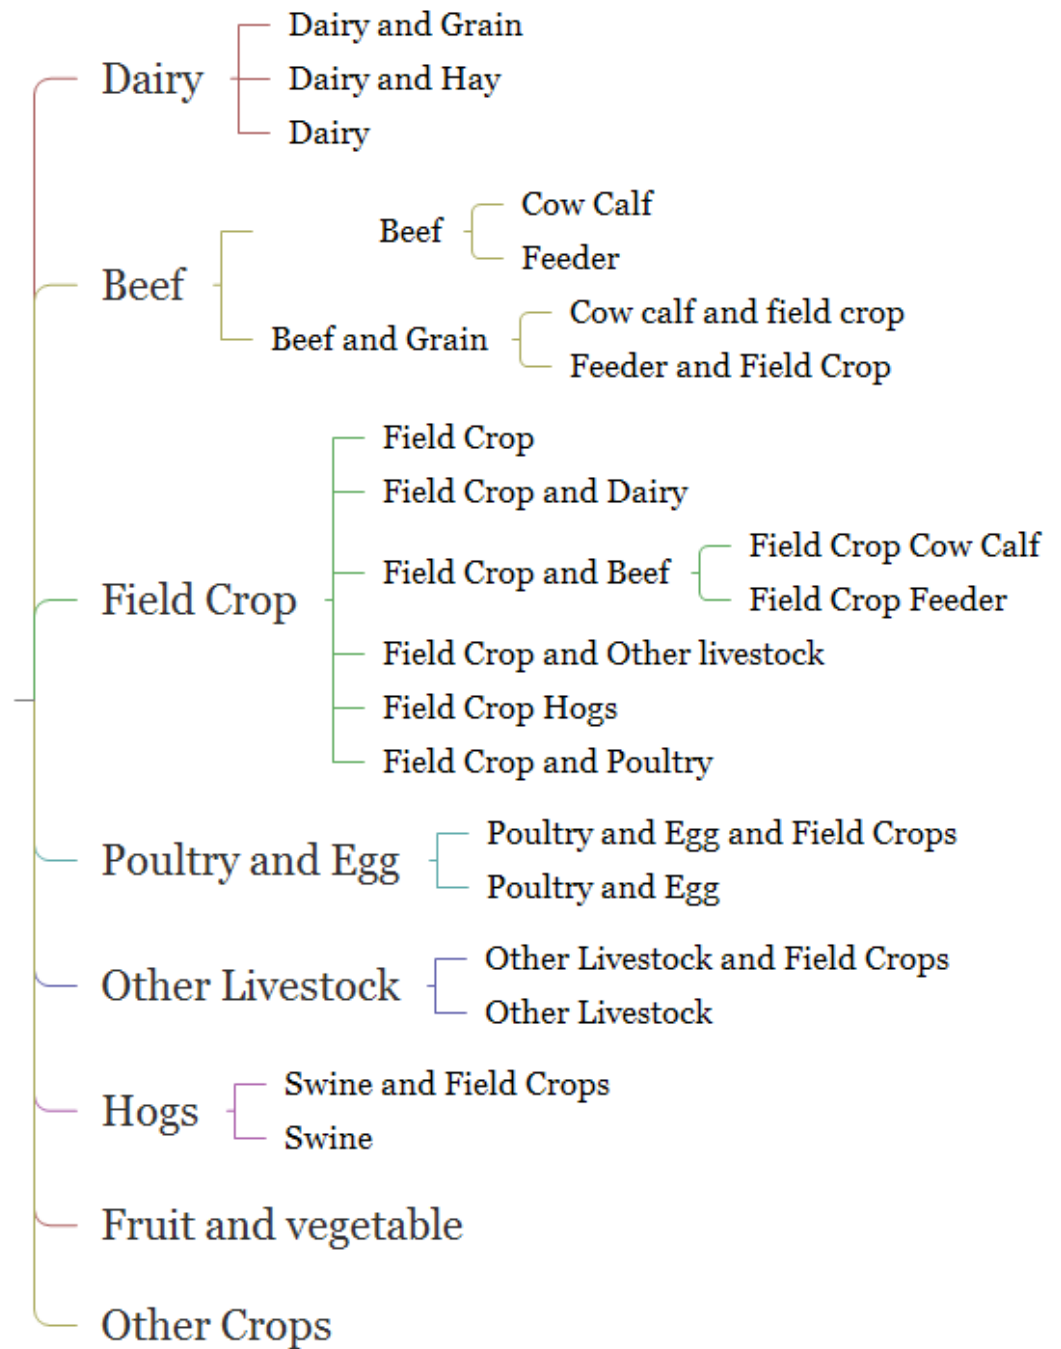

- 2844 farms of 22 farm types
  - Based on census of agriculture statistics
  - Spatially distributed on the landscape
    - Average farm size, not their real locations
- Weather and farming operations follow a daily time step.
  - Maximum and minimum temperature and precipitation.
- Crop development – Phenotypical growth curves.

# Envision Eastern Ontario Model

- Two data classes, Field and farm
  - Fields = Integrated Decision Units (IDU)
    - AAFC Crop cover (2011)
    - Grouped in legal survey (cadastre) polygons
  - Farms = Collection of cadastre polygons

# Farm Types

# Separating classes

<b>Total Field Crop (FC) Farms</b>	<b>725</b>	
FC farms reporting Dairy Cows	29	29 Field Crop Dairy Farms
FC farms reporting Hogs (Sows + Weiner + Grower)	7	7 Field Crop Hog

<b>Total Hog Farms</b>	<b>8</b>	
Hog farms reporting field crops	2	2 Hog Farms with Field Crops
Hog farms without field crop	6	6 Hog only farms

## Dairy and Field Crop

		Business as Usual	Cool and Wet	Cool and Dry	Warm and Wet	Warm and Dry
April	Week 5					
	Week 6		delay	cereals go in	same as cold and wet for all situations	same as normal year.
	Week 7	April 17	delay			
	Week 8		delay switch corn			
May	Week 9	1. Corn starts May 1 2. alfalfa seeded under seeded to an annual forage crop (cereal).	delay until conditions improve	delay		
	Week 10		delay	corn starts		
	Week 11	soy - may 10	delay			
	Week 12		delay	soy delay		
	Week 13		If corn not seeded May 24 corn acres switch to soy			

# Crop Rotations

- Generalized crop rotations
  - Corn – Soy – Cereal
  - Corn – Soy – Corn – Soy – Cereal
    - Field Crop Only farms
    - Field crop and confined livestock (poultry and hog)
  - Corn – Soy – Cereal – Alfalfa – Alfalfa – Alfalfa
  - Corn – Soy – Corn - Soy – Cereal – Alfalfa – Alfalfa – Alfalfa
    - Field Crop farms with livestock (dairy or beef)

Initiate April 1 year one

Assign rotations based on farm types

Calculate Cereal start date for each Ecodistrict

April 17

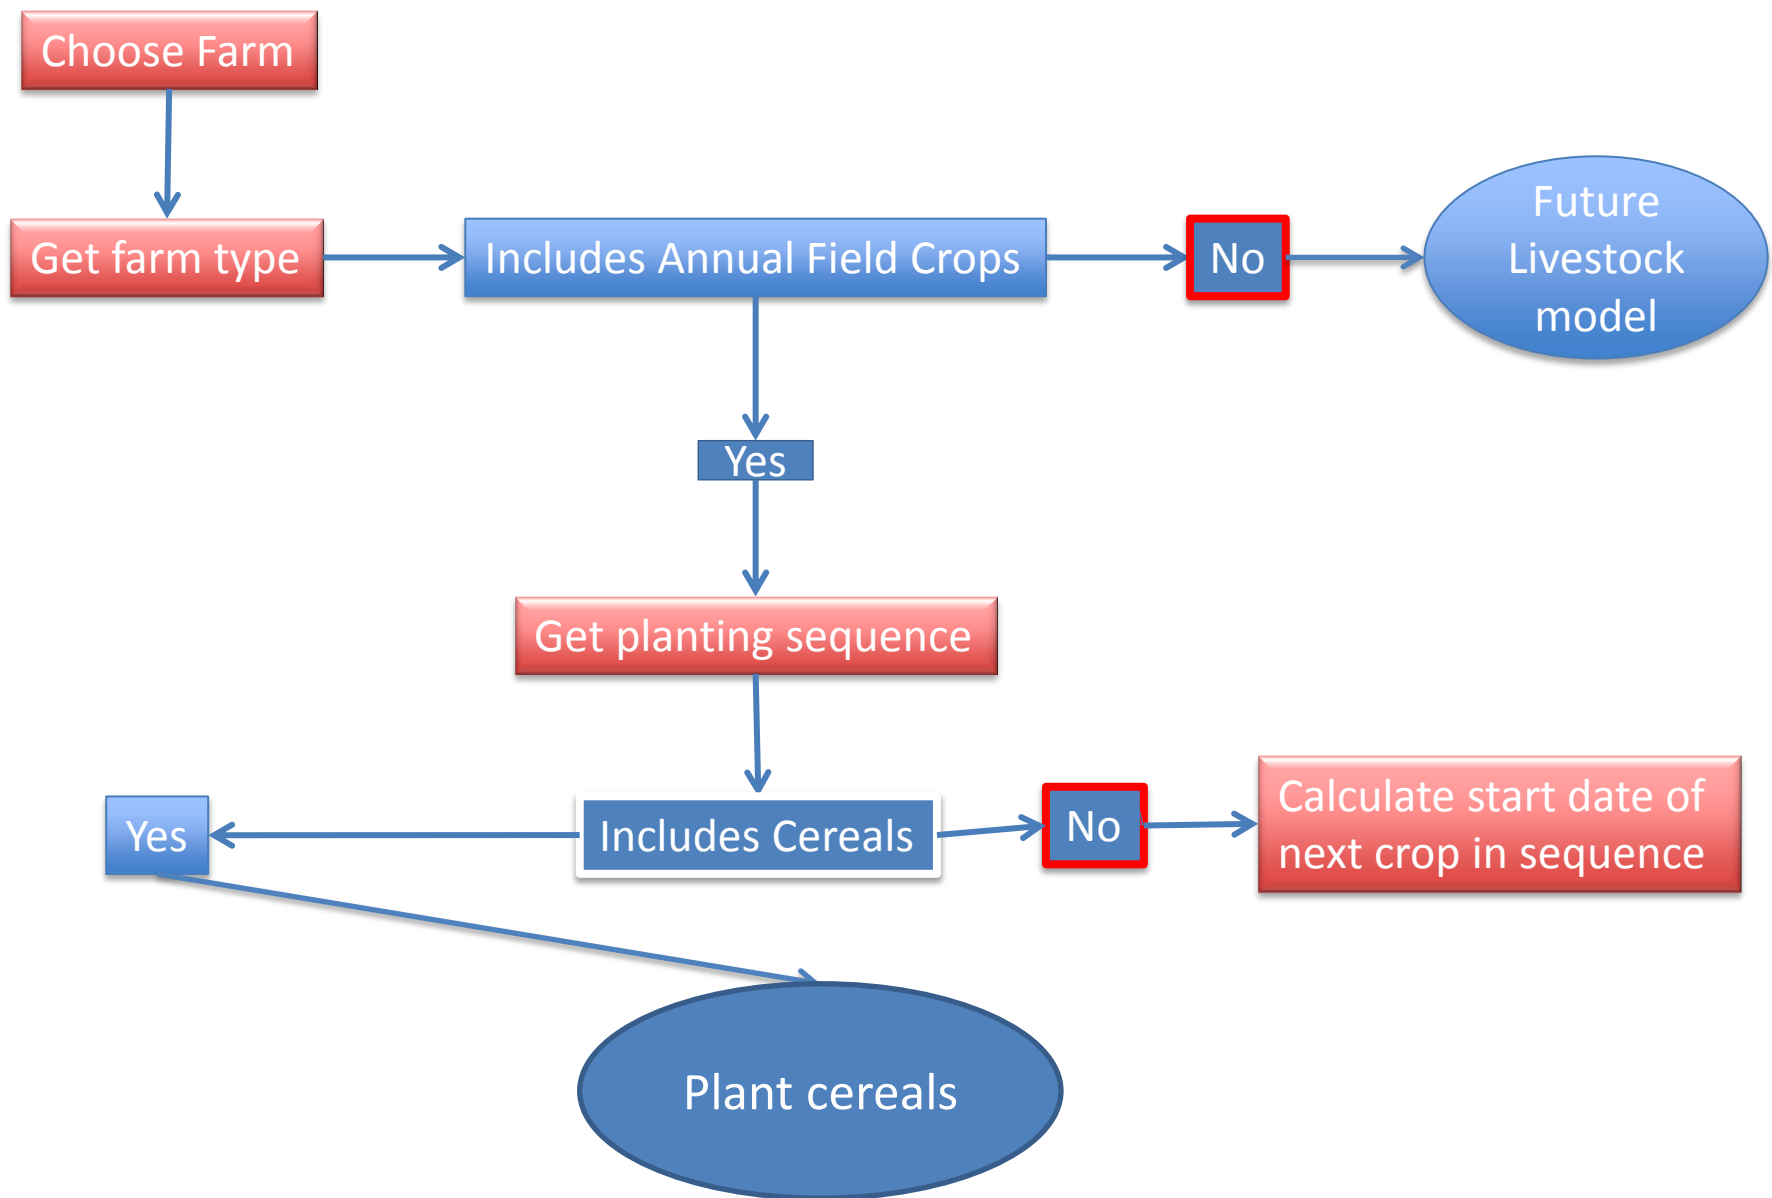

Temperature conditions met?

yes

no

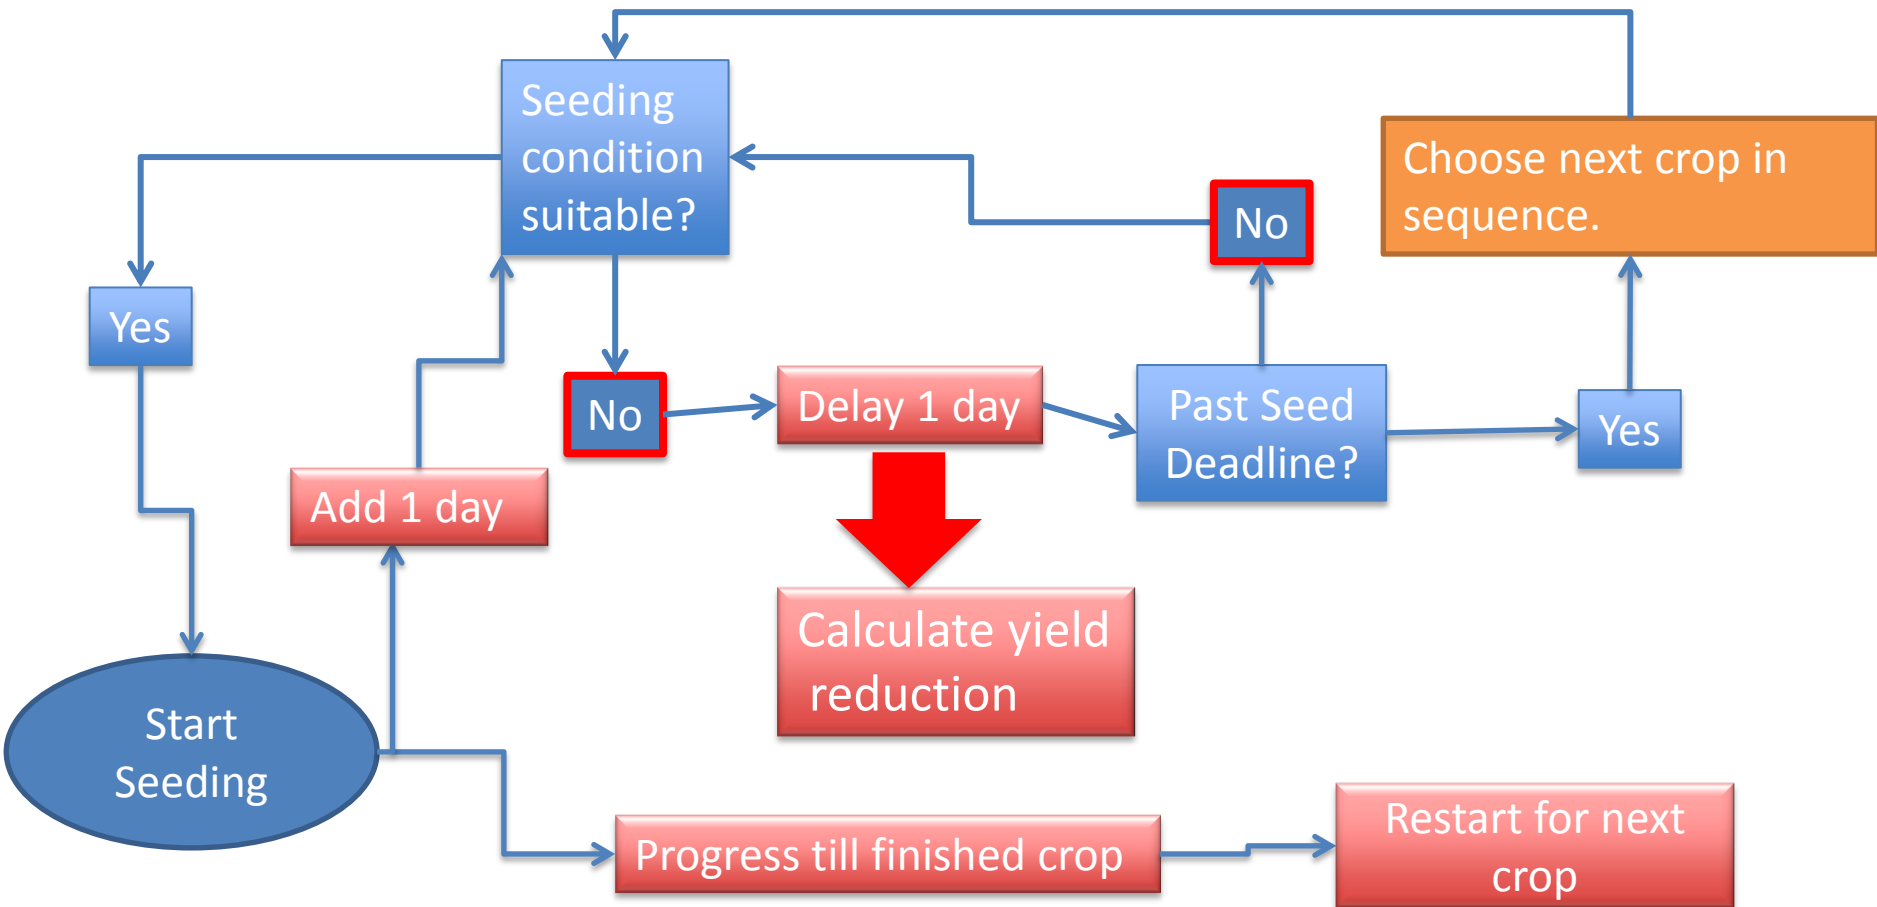

Delay 1 day

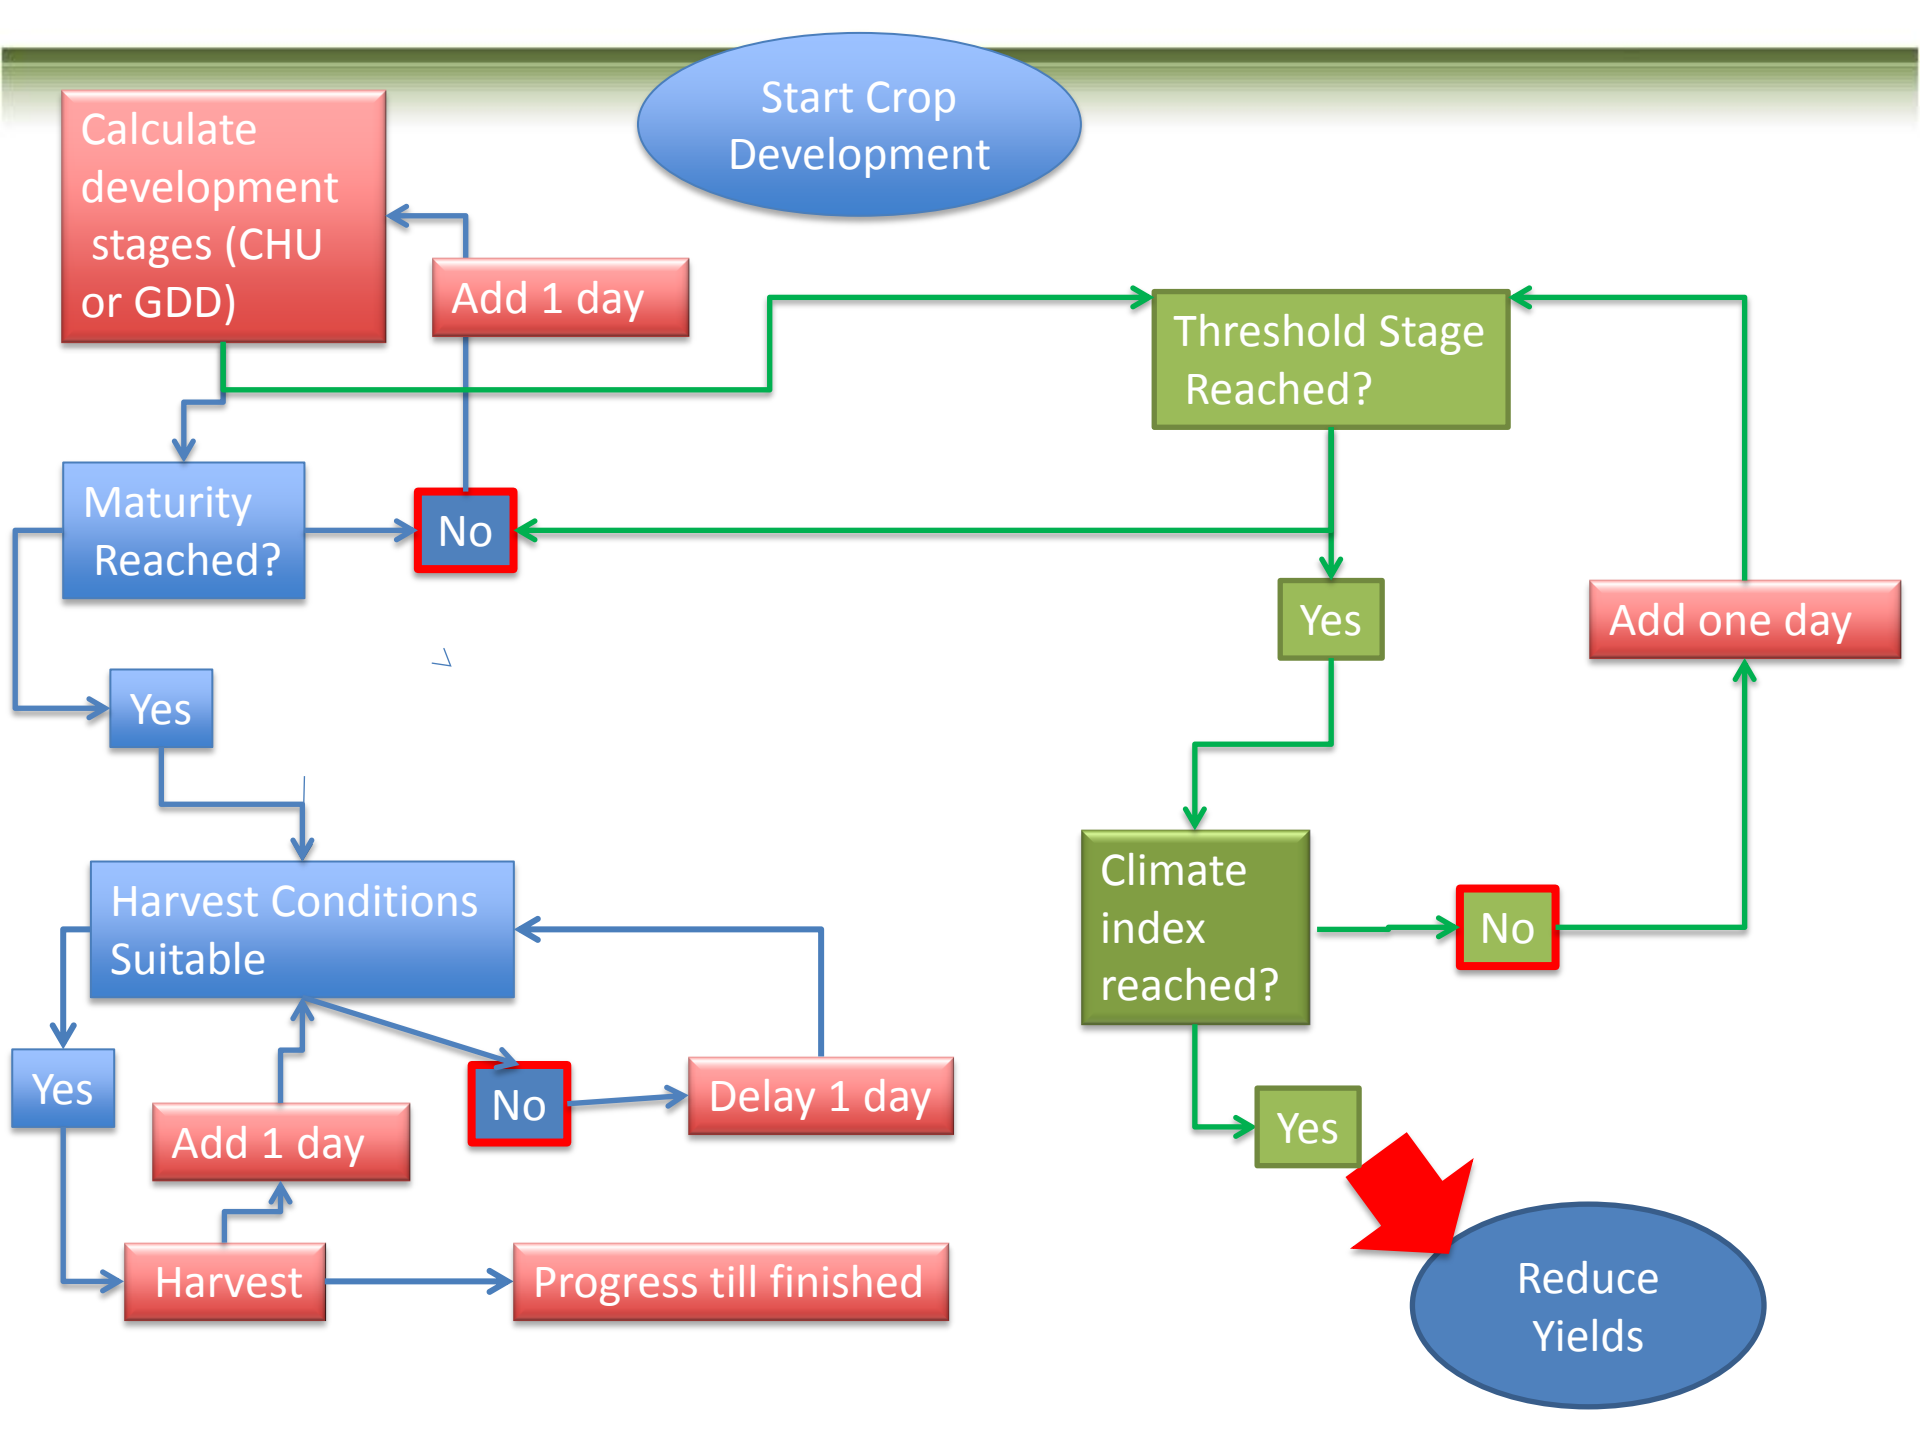

Start Farming operations

Plant cereals

Daily loop

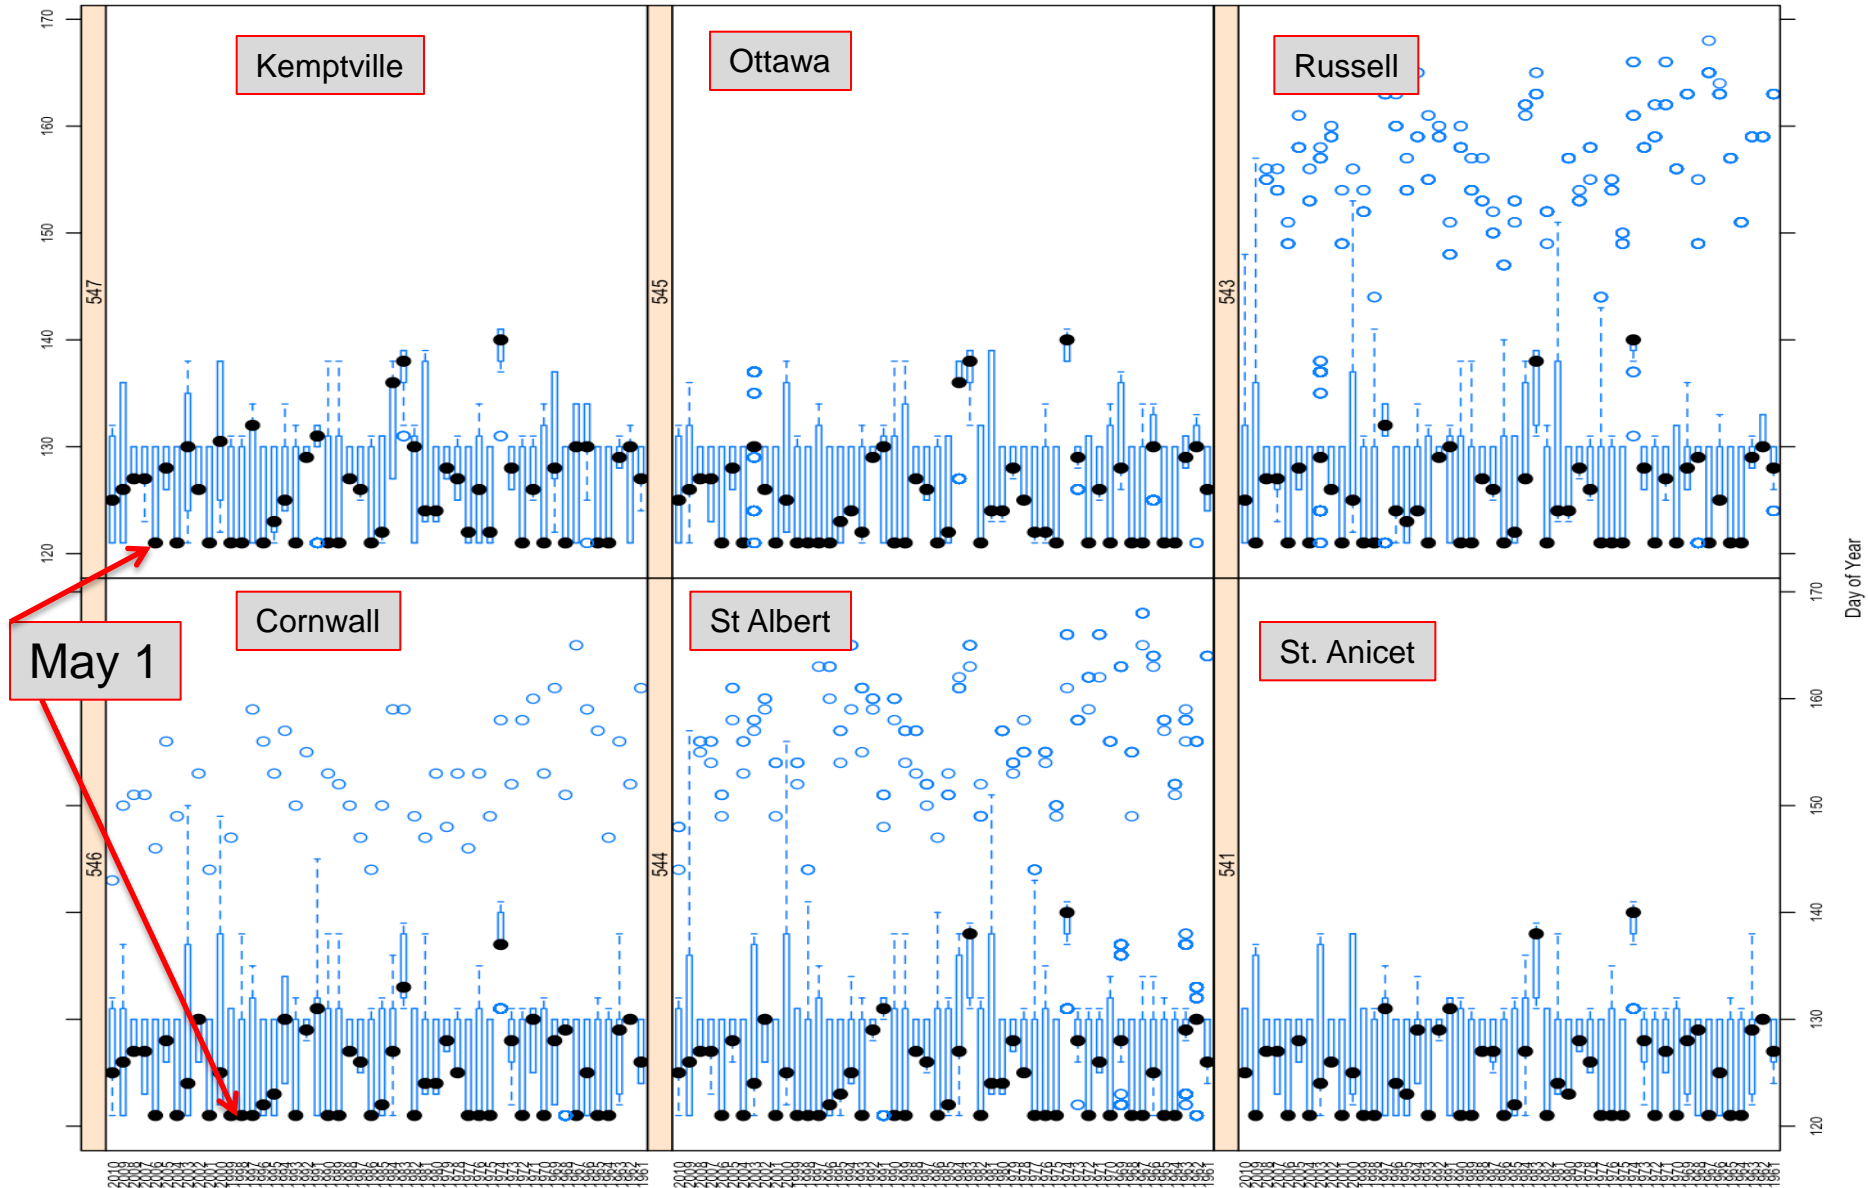

# Weather Impacts – Seeding Date

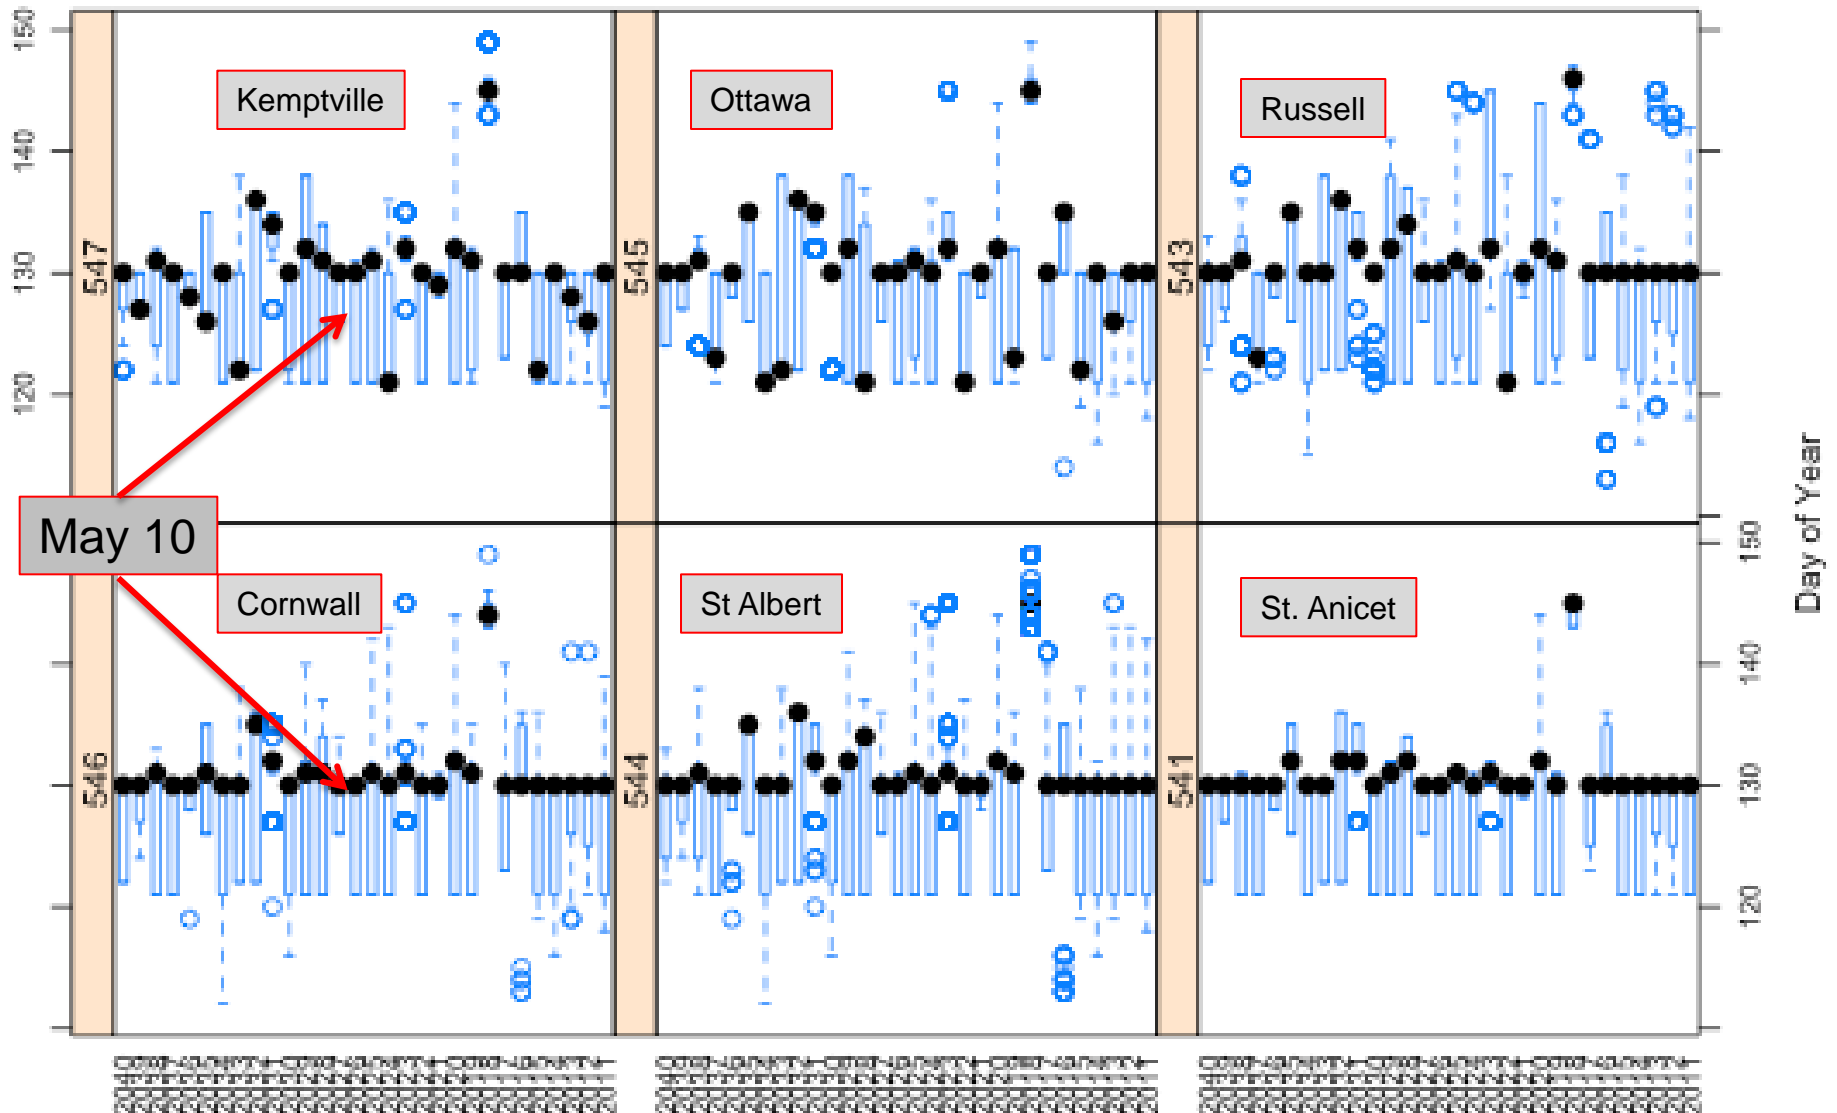

30% increase in 7 day ppt over 30 year average = delay 1 day

# Average Planting date - historic

# Average Planting date - CCSM

# Questions, comments?
