

Symposium:

Risk factors for sexual violence and intimate partner violence: How much overlap is there?

ATSA Conference

October 2024, San Antonio, Texas

Presentations:

- Beyond boundaries: Risk factors for sexual aggression and intimate partner violence among Canadian university students
 - Natasha Usenko
- Comparing Risk/Need Profiles in Men with a Sex Offence History, With and Without a Known IPV History
 - Seung Lee
- What predicts domestic violence versus sexual recidivism in men with both types of offences?
 - Maaïke Helmus (& Myles Davidson)

Learning Goals

- a. Upon completion of this learning activity, participants will be able to identify which risk factors pertinent to general and sexual offending are predictive of non-sexual intimate partner violence and/or general sexual aggression.
- b. Upon completion of this learning activity, participants will be able to reflect on how the risk and need profiles of men with both IPV and sexual offending histories compares to men exclusively with sexual offending histories.
- c. Upon completion of this learning activity, participants will be able to understand which risk factors most accurately predict sexual, IPV, and any recidivism.

SCAN ME

Beyond boundaries: Risk factors for sexual aggression and intimate partner violence among Canadian university students

Natasha Usenko, B.A. (Hons.)
nusenko@sfu.ca

56% of women aged 15 to 24, who have been in an intimate partner relationship, reported experiencing some form of IPV at least once

 SCAN ME

 SCAN ME

33% of women reported one incident of victimization of intimate partner sexual violence

16% of men reported at least one incident of perpetration

 SCAN ME

Explore risk factors pertinent to general and sexual offending and their prediction of attempted or actual sexual aggression, intimate partner sexual violence, and non-sexual intimate partner violence

 SCAN ME

Outcomes

Revised Conflict Tactics Scale Short Form (CTS2-SF; Straus & Douglas, 2004)

- Intimate Partner Sexual Violence & Non-sexual IPV behaviour

Updated Illinois Rape Myth Acceptance Scale (UIRMAS; McMahon & Farmer, 2011)

- Antisocial Thoughts

Sexual Experiences Survey – Short Form Perpetration (SES-SFP; Koss et al., 2006)

- Actual or attempted sexual aggression

General Criminality Factors

Triarchic Psychopathy Measure (TriPM; Patrick et al., 2009)

- Antisocial Personality

Revised Attraction to Sexual Aggression Scale (ASA; Malamuth, 1998a; Malamuth, 1998b)

- Antisocial Peers: Willingness to engage in Illegal behaviour & History of Illegal Behaviour

Sexual Risk Factors

Revised Attraction to Sexual Aggression Scale (ASA; Malamuth, 1998a; Malamuth, 1998b)

- Sexual Preoccupation & Deviant Sexual Interests

Other Factors

Experiences in Close Relationships – Revised (ECR-R; Fraley et al., 2000)

- Attachment-related Anxiety

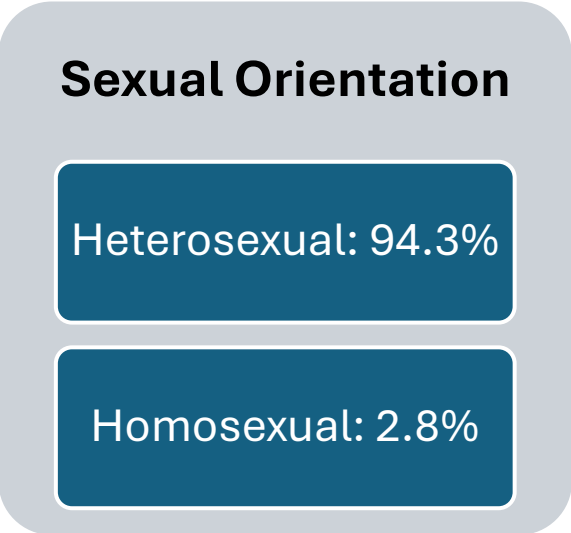

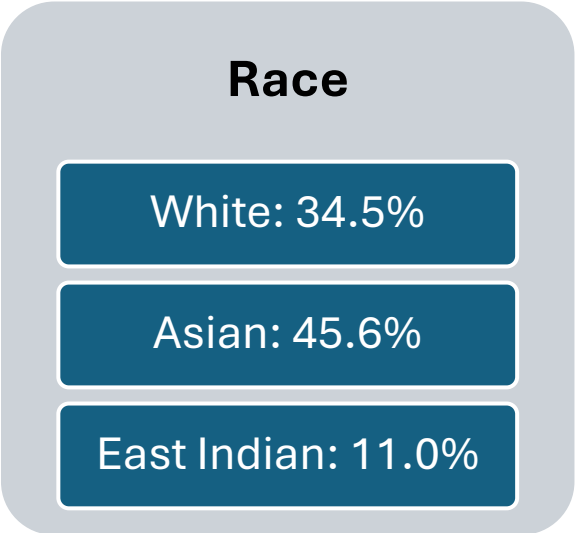

HEXACO

- Honesty-Humility & Emotionality

Survey of Obsessive Relational Intrusion (SORI; Spitzberg & Cupach, 2014)

- Invasion, Harassment & Intimidation & Coercion/Threat

Demographics: Male (*n* = 281)

Romantic Relationship

- Current Relationship: 41.3%
- Age of First Relationship: 10-21 years old (\bar{x} = 15.61)
- Number of Previous Relationships: 0-20 (\bar{x} = 2.57)
- Longest Relationship: 1 month – 18 years (\bar{x} = 1 year & 7 months)
- Shortest Relationship: 2 weeks – 7 years & 1 week (\bar{x} = 7 months)

Demographics: Female ($n = 535$)

 SCAN ME

Age

Under 18: 5.2%

18-24: 91.4%

Race

White: 35.5%

Asian: 40.6%

East Indian: 13.6%

Sexual Orientation

Heterosexual: 78.3%

Bisexual: 16.4%

Romantic Relationship

- Current Relationship: 52.5%
- Age of First Relationship: 8-23 years old ($\bar{x} = 15.51$)
- Number of Previous Relationships: 0-20 ($\bar{x} = 2.47$)
- Longest Relationship: 1 week – 19 years ($\bar{x} = 1$ year & 7 months)
- Shortest Relationship: 1 week – 4 years ($\bar{x} = 5$ months & 3 weeks)

Outcomes

 SCAN ME

Males ($n = 281$)

- *Actual or Attempted Sexual Aggression: 45 cases (16%)*
- *Intimate Partner Sexual Violence: 45 cases (16%)*
- *Non-Sexual Intimate Partner Violence: 29 cases (10.3%)*

Females ($n = 535$)

- *Actual or Attempted Sexual Aggression: 40 cases (7.5%)*
- *Intimate Partner Sexual Violence: 35 cases (6.5%)*
- *Non-Sexual Intimate Partner Violence: 73 cases (13.6%)*

 SCAN ME

General criminality factors, particularly antisocial peers and antisocial attitudes, are most relevant when predicting actual or attempted sexual aggression, intimate partner sexual violence, and non-sexual intimate partner violence across men and women

Sexual offending factors, specifically sexual preoccupation and deviant sexual interests, are relevant when predicting intimate partner sexual violence across men

Comparing Risk/Need Profiles in Men with a Sex Offence History, With and Without a Known IPV History

Seung C. Lee

seungcleel8@gmail.com

ATSA Conference

October 2024, San Antonio, TX

Overview

01 Introduction

02 Objective & Hypotheses

03 Methodology

04 Demographic Info.

05 Risk/Need Profile

06 Conclusion

Introduction

Intimate Partner Violence (IPV)

Physical abusive behaviors within intimate relationship

Lack of attention to whether sexual assault is considered part of IPV offences

Potential differences in characteristics and risk profiles

More General Criminality in IPSV

Higher prevalence of simultaneous physical and sexual assaults

More serious physical violence and severe forms of coercion

More criminal offenses

Greater instability in partner relationships

Higher rates of substance abuse

Objectives

Objective 1

Compare individuals with and without an IPV history on basic demographic variables (e.g., age, education, racial/ethnic groups).

Objective 2

Compare risk factors in the Static-99R and STABLE-2007 to distinguish between general antisociality and sexual offending-specific risk factors.

Hypothesis

Objective 1

H1: No specific hypothesis

Objective 2

H2: Individuals with an IPV history will exhibit higher general criminality, but there will be no significant differences in sexual criminality.

Additionally, those with an IPV history are expected to show greater instability in partner relationships.

Methodology

Sample

Adult men supervised and assessed by parole or probation officer on Static-99R or STABLE-2007 sexual recidivism scales in British Columbia between 2005 and 2013

Measures

IPV indicator

Spousal Assault Risk Assessment (Yes or No)

Risk/Need profile

Static-99R (10 static items)

STABLE-2007 (13 dynamic items)

Methodology

Sexual Recidivism Constructs

Sexual Criminality

Non-contact sexual offence
Male victim
Prior sexual offence
Emotional congruence with children
Sexual preoccupation
Sex as coping
Deviant sexual interest

General Criminality

Prior sentencing occasion
Prior nonsexual violence
Hostility toward women
lack of concern for others
Impulsivity
Poor problem solving skills
Cooperation with supervision
Significant social influences
Negative emotionality

Youthful Stranger Aggression

Age
Never lived with lover
Index nonsexual violence
Unrelated victim
Stranger victim
Capacity for relationship stability

Methodology

Statistical method

AUC (Area Under the Curve)

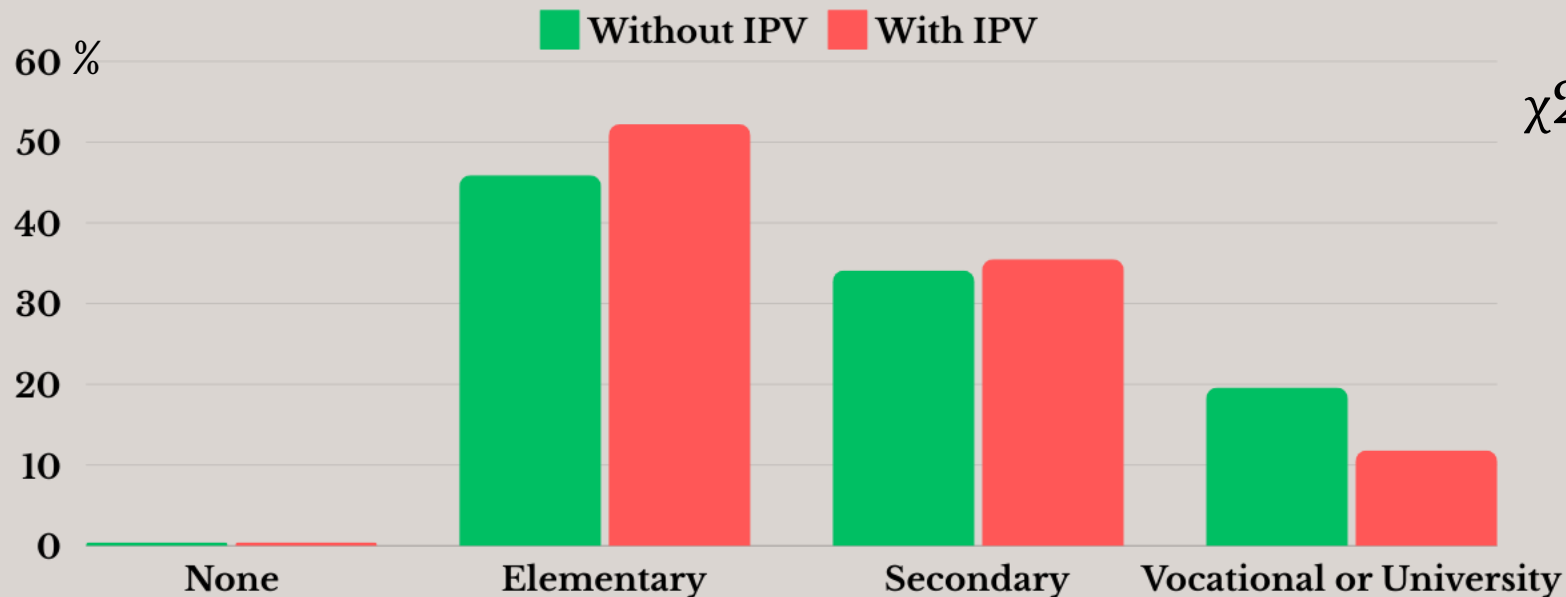

Note. If 95% CI contains .50 = no significant difference.

Demographic Information

Age

Without IPV ($n = 4,027$)	With IPV ($n = 479$)	AUC [95% CI]
$M = 41, SD = 14$	$M = 38, SD = 11$.46 [.43, .48]

Education

$\chi^2 (3, N = 4,158) = 17.4, p < .001.$

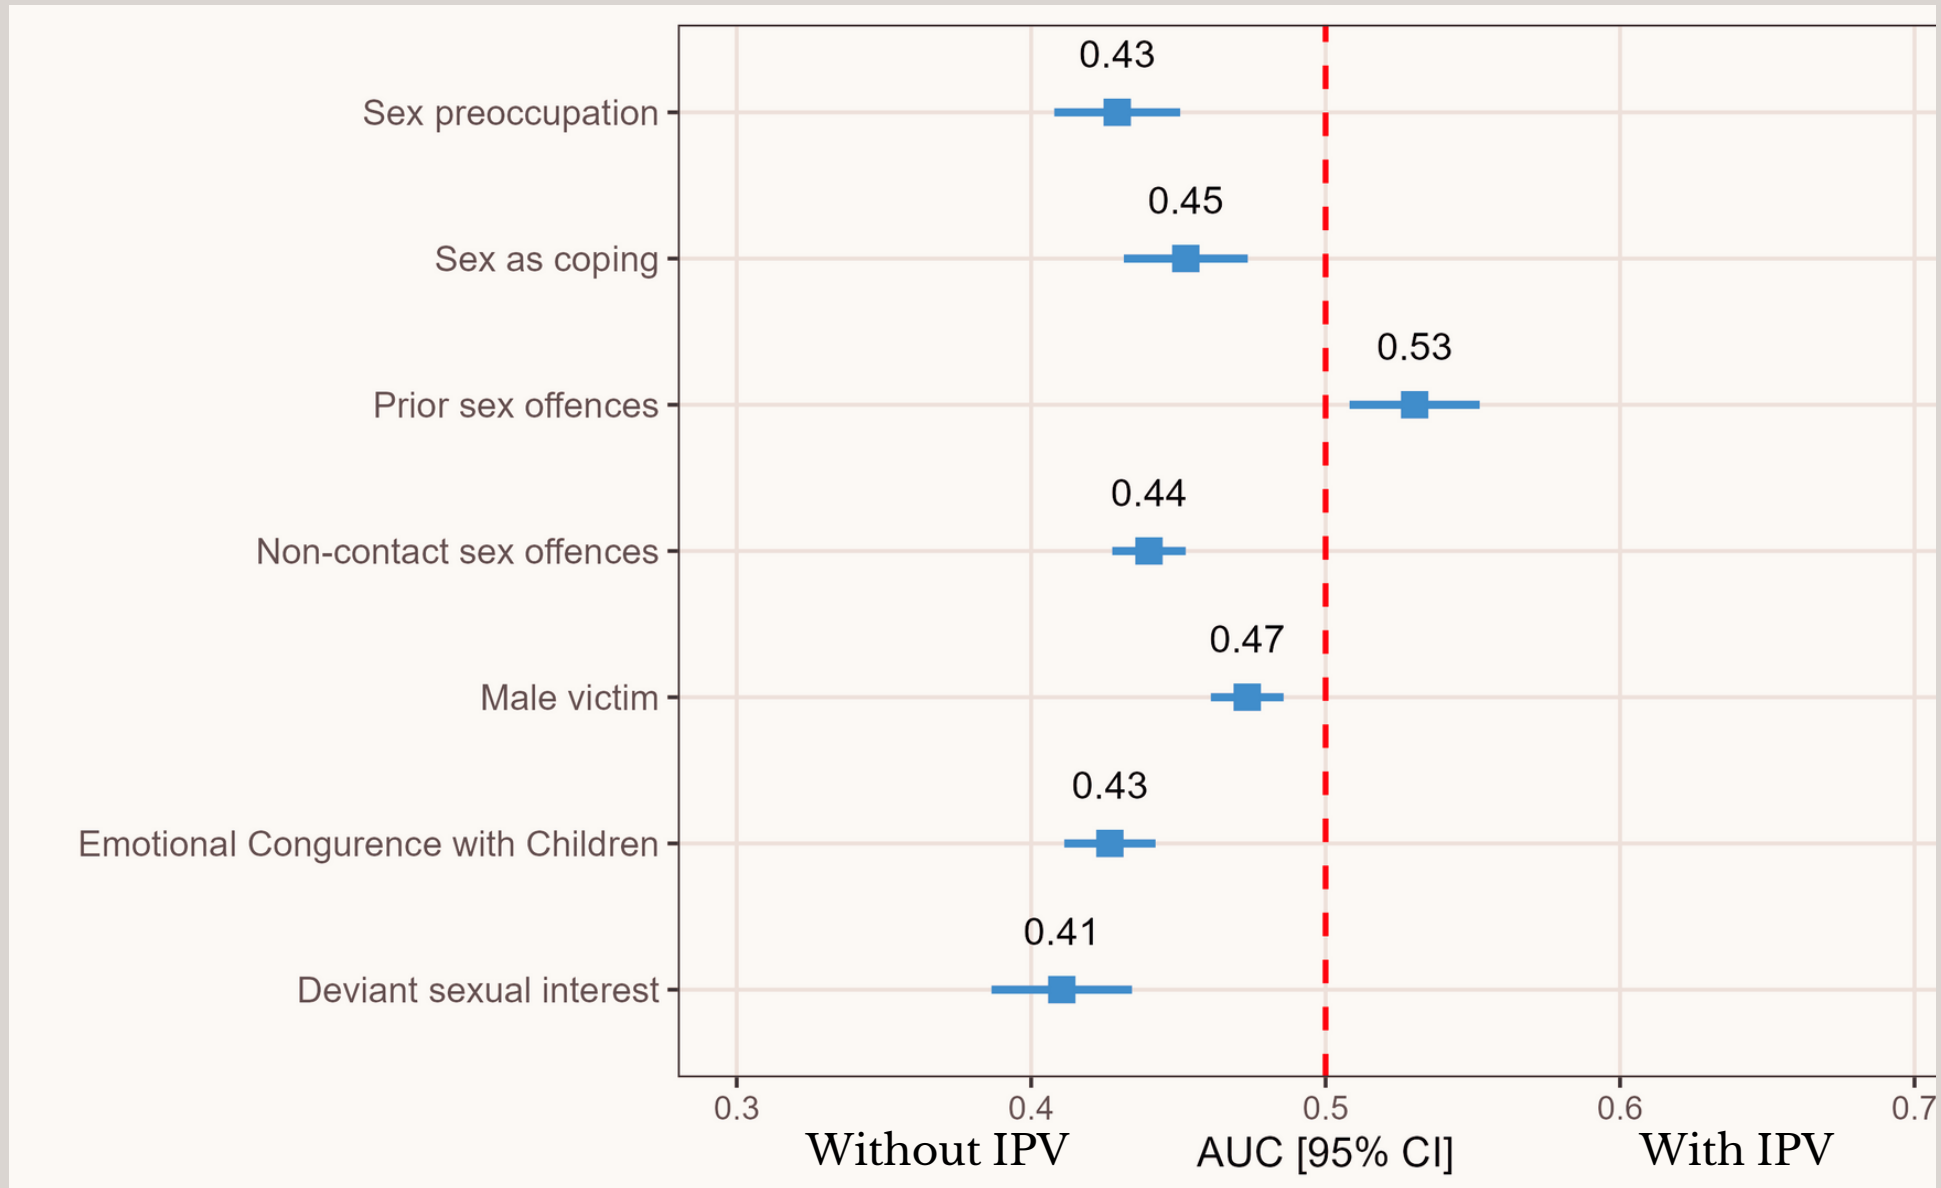

Demographics

Race/Ethnicity

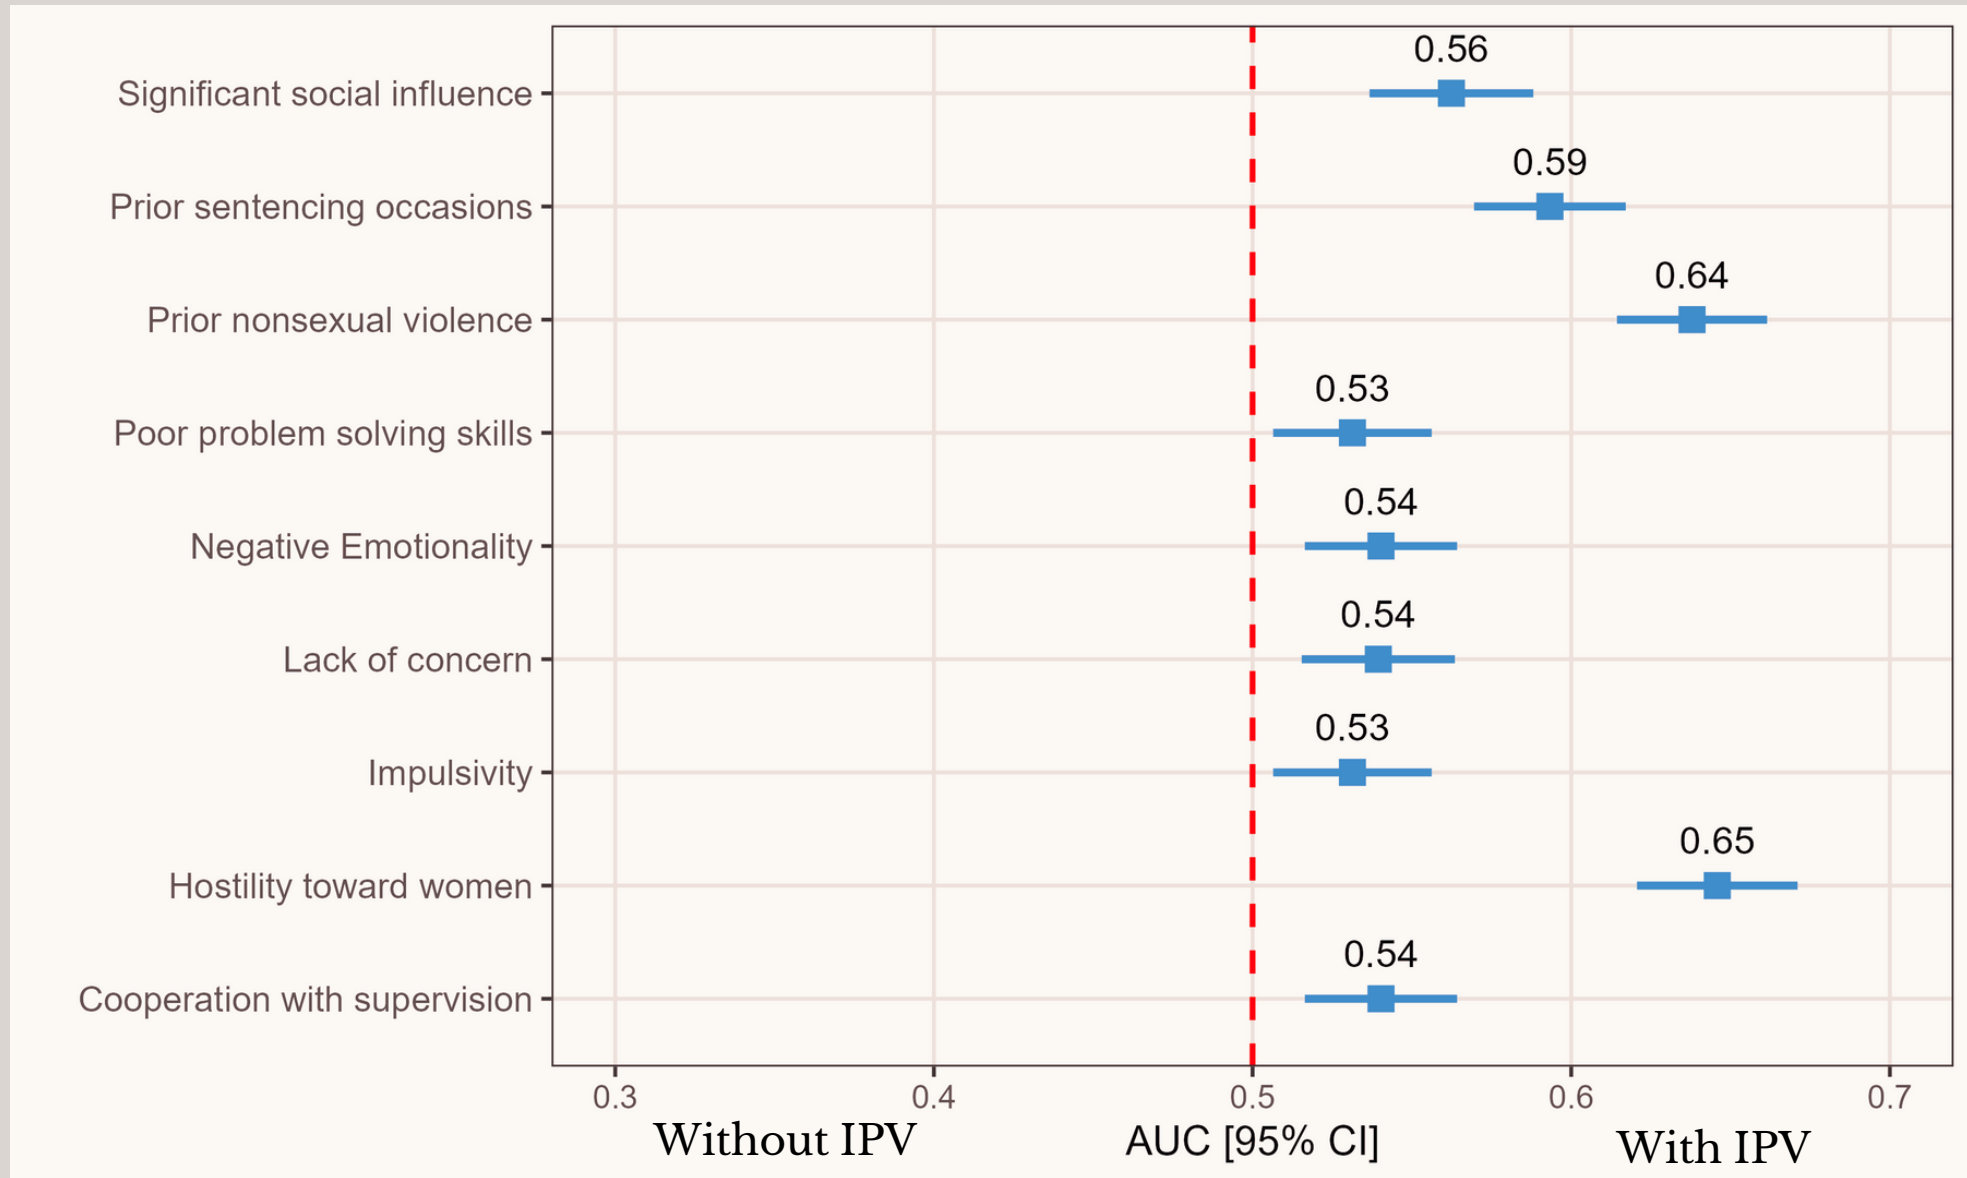

Without IPV With IPV

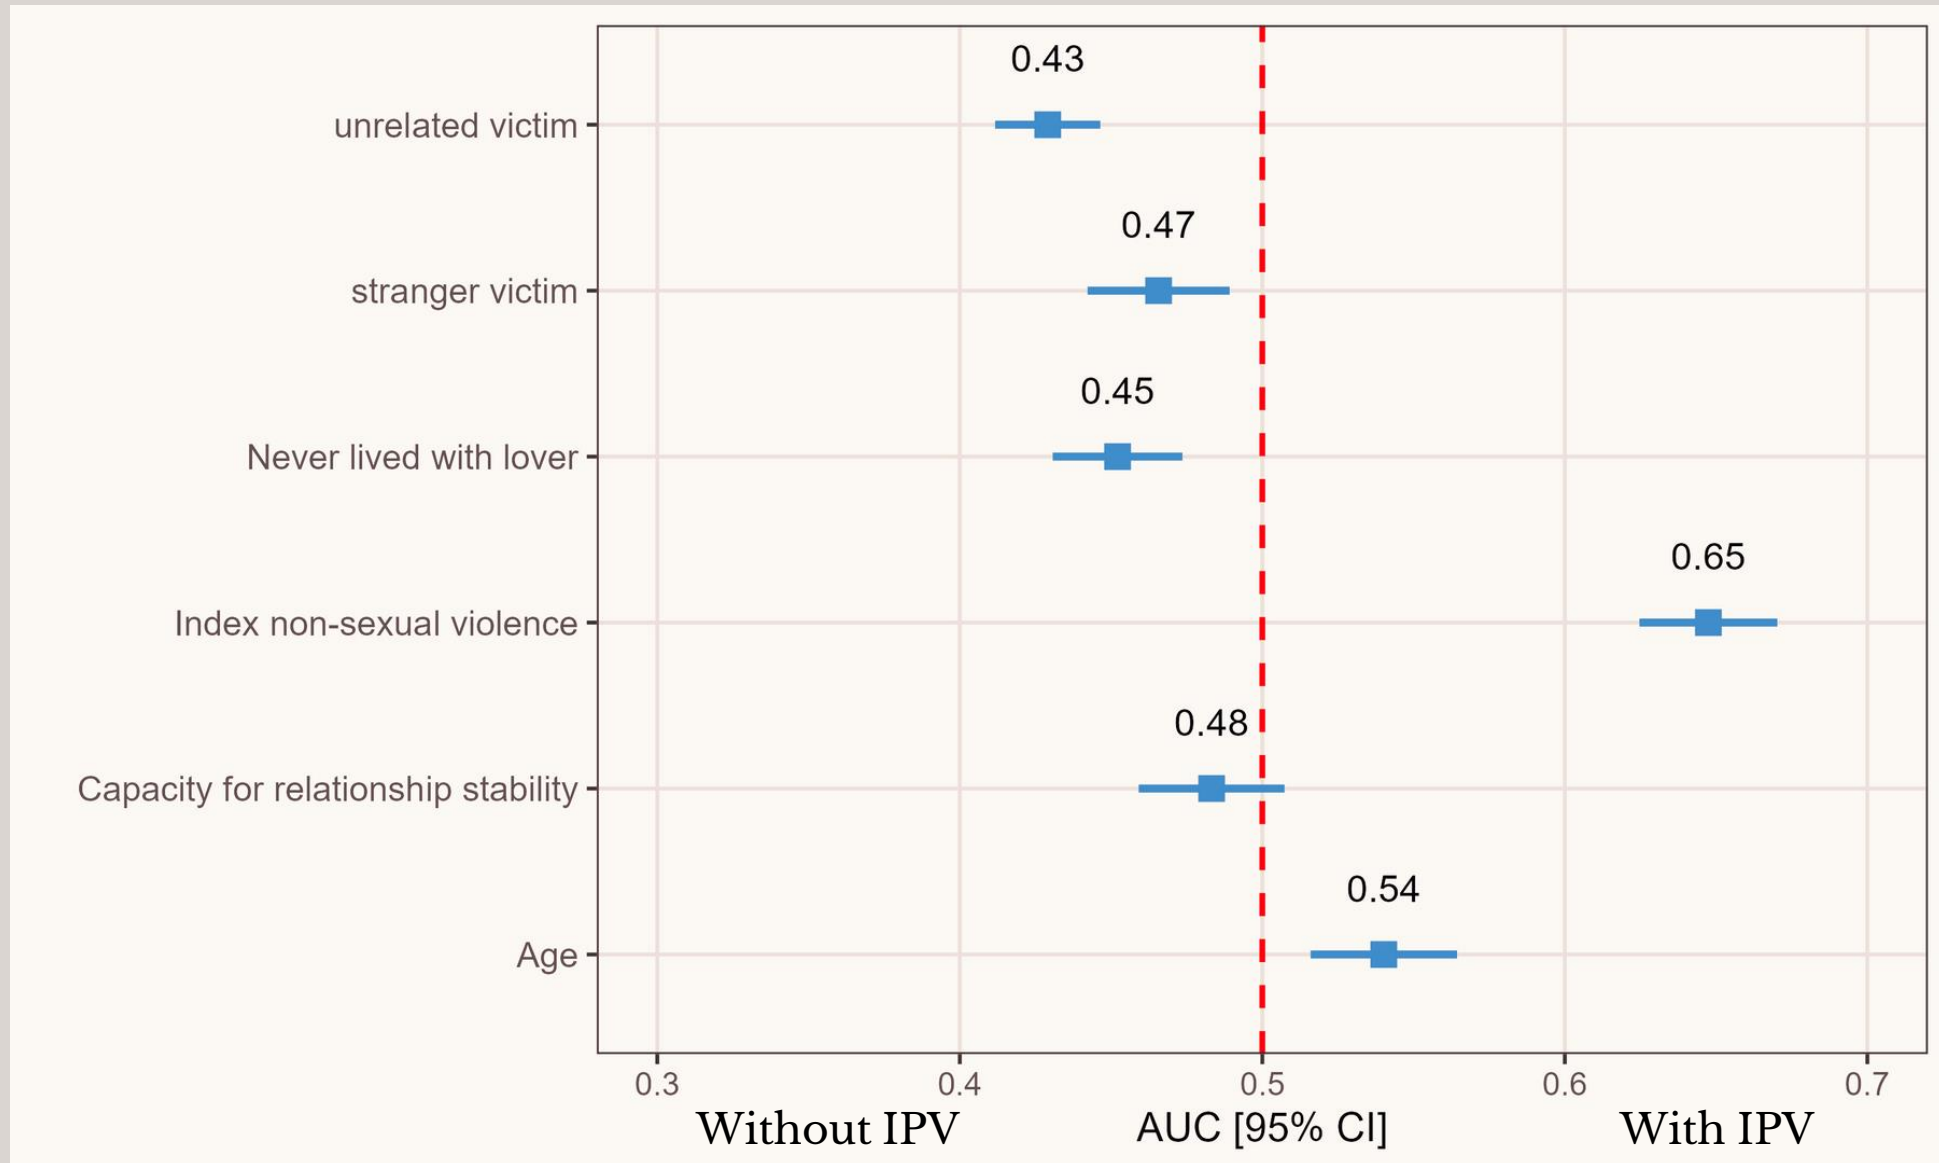

Sexual Criminality

General Criminality

Youthful Strange Aggression

Construct Difference

Without IPV

.50

With IPV

Sexual Criminality
AUC = .46 [.43, .48]

General Criminality
AUC = .64 [.61, .67]

Youthful Stranger Aggression
AUC = .52 [.49, .55]

	Without IPV	With IPV
Sexual Criminality	$M = 1.67, SD = 1.65$	$M = 1.24, SD = 1.24$
General Criminality	$M = 2.46, SD = 2.08$	$M = 3.46, SD = 2.13$
Youthful Stranger	$M = 1.66, SD = 2.04$	$M = 1.84, SD = 1.73$

Summary

Significant differences on

Demographic Information

Individuals with an IPV history were generally younger, had lower education levels, and included a higher proportion of Indigenous individuals.

Risk/Need Profile

Those with an IPV history showed higher general criminality but lower sexual criminality.

No significant (or reversed) difference in relationship instability.

Implications

Targeted Interventions

The distinct profiles of individuals with IPV histories, including higher general criminality but lower sexual criminality, suggest that intervention programs should be tailored to address specific risk factors associated with general criminality.

Future Research Directions

The findings underscore the importance of further research to explore the unique risk factors related to IPSV and to understand the complexities of relationship instability across different cultural contexts.

Policy Development

Policymakers should consider integrating findings related to demographic differences and risk profiles into IPV prevention strategies to enhance their effectiveness and address the needs of vulnerable populations.

Limitations

IPV Indicator

The study relied solely on the SARA indicator for identifying IPV.

Lack of Information

There is no specific data regarding sexual IPV, limiting the analysis of this critical aspect.

Cultural Background

The study lacks adequate representation of cultural backgrounds, particularly among Indigenous populations, which may affect the generalizability of the findings.

Thank You

Seung C. Lee

What predicts domestic violence versus sexual recidivism in men with both types of offences?

L. Maaïke Helmus & Myles Davidson

Lmaaikehelmus@gmail.com

ATSA Conference

October 2024, San Antonio, Texas

- The current city of Vancouver rests on traditional and unceded lands of the Coast Salish Peoples.
- I would like to respectfully acknowledge the unceded traditional territories of the Sk̓w̓x̓w̓ú7mesh Úxwumixw (Squamish), səlilw'ətaʔl (Tsleil-Waututh) and x^wməθk^wəy'əm (Musqueam) Nations.
- Native-land.ca

Maaike Helmus

ENGAGING THE WORLD

Myles Davidson

Carleton
University

Considerations in Picking Risk Assessment Tools

- Helmus & Olver (2024)
- Bare minimum (if no other tool exists): Significant predictive accuracy, at least as good if not better than unstructured clinical judgement (AUC of .56+)
- Match between tool and referral question (e.g., outcome?)
- Volume/quality of research
- Availability and quality of recidivism estimates
- Interrater reliability
- Comprehensive and empirically supported risk factors
- Inform treatment targets and assessments of change
- Quality of training/implementation resources

Preliminary Hypotheses

- Sexual recidivism should be best predicted by risk tools designed for sexual recidivism
 - Supported by Hanson & Morton-Bourgon (2009) meta-analysis
- Domestic violence recidivism should be best predicted by risk tools designed for domestic violence (like the SARA)
 - Not supported by Hanson, Helmus, & Bourgon (2007) meta-analysis
- Raises questions about relative importance of generic and specialized risk factors

General Risk Factors (Central 8; Andrews & Bonta)

The "Central Eight" Risk Factors	The "Big Four" Risk Factors	History of antisocial behaviour
		Antisocial personality pattern
		Antisocial attitudes/cognition
		Antisocial associates
		Family and/or marital
		School and/or work
		Leisure and/or recreation
		Substance abuse

Specialized Risk Factors for Sexual Recidivism (Mann et al., 2010; Brankley et al., 2021)

- Prior sex offences
- Emotional congruence with children
- Deviant sexual interests
- Sexualized coping
- Sexual preoccupation

Specialized Risk Factors for Domestic Violence?

- Not as well established
- New meta-analysis by Helmus, Perley-Robertson, & Hilton (in progress) concluded that IPV risk tools tend to:
 - Underweight Central 8
 - Omit important risk factors (e.g., jealousy)
 - Include unsupported risk factors (e.g., weapon use, victim vulnerability items)
 - Place too much emphasis on index offence

Purpose of Current Study

- Which risk factors and tools best predict sexual, DV, any violent, and any recidivism among men with a history of both DV and sexual offences?
- What does this say about generality and specialization of risk factors? Of treatment needs? Treatment/management implications?

Dataset Obtained from.....

Field Validity of Static-99R and STABLE-2007 With 4,433 Men Serving Sentences for Sexual Offences in British Columbia: New Findings and Meta-Analysis

L. Maaïke Helmus¹, R. Karl Hanson², Daniel C. Murrie³, and Carmen L. Zabarauckas⁴

¹ Department of Criminology, Simon Fraser University

² Department of Psychology, Carleton University

³ Institute of Law, Psychiatry, and Public Policy, University of Virginia

⁴ Ministry of Attorney General (British Columbia) and Department of Criminology, Simon Fraser University

Sample

- Men with IPV offences (479 from Seung Lee's presentation)
 - Had received an assessment on the Spousal Assault Risk Assessment (SARA)
- Originally supervised and assessed on Static-99R or STABLE-2007 by BC Corrections between 2005 and June 2013
- Static-99R, STABLE-2007, and SARA scored by probation officers; other variables available from BC criminal records

Recidivism data

- Charges or convictions in British Columbia
- Mean follow-up of roughly 4.5 years
 - Mean follow-up = 4.5 years (n = 3,468)
- Recidivism Outcomes
 - Sexual (5.6%, n = 27)
 - Domestic violence (30.5%, n = 146)
 - Any violent (39.0%, n = 187)
 - Any criminal recidivism (43.0%, n = 206)

Predictive Accuracy

- Harrell's C (similar to an AUC)
- Values of .56, .64, and .71 are small/moderate/large (Helmus & Babchishin, 2017)
 - Statistically significant are noted in **bold (for risk factors, also an *)**
- Mann et al. (2010): Cohen's d of .15 is large enough to consider something an empirically supported risk factor
 - Equivalent to an AUC/C of .54 and above
 - Noted in **green**

Risk Assessment Tools

Total SARA score	467	.63	[.59, .67]

Let's Look at Risk Factors!

What risk factors should be specialized or universal?

- Risk factors classified BEFORE conducting analyses
- Consensus decisions reached by both co-authors
- Risk factors classified as:
 - Universal (e.g., Central 8)
 - Specific to sexual offending
 - Specific to domestic violence
 - Specific to SO and DV

Specialized Risk Factors

Items Hypothesized to be Specific to Sexual Recidivism

Item	N	Recid Type		
		Sex	DV	Vio
		C	C	C
Static 99-R				
Prior sex offences	467	.50	.56*	.54*
Non-contact sex conviction	467	.58*	.51	.50
Any unrelated victim	467	.50	.53	.52
Any stranger victim	467	.49	.51	.51
Any male victim	467	.61*	.51	.51

Stalking	479	.52	.52*	.52*
Other				
Rapist attitudes	169	.55	.51	.51
Sexual entitlement attitudes	169	.62	.53	.51
Torture of partner/sadism	471	.50	.51*	.51*

Let's look at more universal risk factors (general criminality)

Summary of Results for Items Hypothesized to be Universal Risk Factors (or Part of Central 8)

Item	N	Sex Recidivism C	DV Recidivism C	Violent Recidivism C	Any Crime C	Any Recidivism C
Static 99R						
Never lived with lover	467	.65*	.50	.53	.54*	.54*
Index non-sexual violence	467	.57	.52	.52	.51	.51
Prior non-sexual violence	467	.55	.57*	.57*	.57*	.57*
Prior sentencing dates	467	.54	.56*	.57*	.58*	.59*
STABLE-2007						
Significant social influences	467	.60	.57*	.57*	.58*	.60*
Capacity for relationship stability	467	.61*	.53	.56*	.55*	.56*
Lack of concern for others	467	.60	.55*	.58*	.58*	.57*
Impulsive acts	466	.64*	.58*	.59*	.59*	.58*
Poor cognitive problem solving	466	.55	.57*	.59*	.59*	.59*
Negative emotionality/hostility	465	.50	.54*	.55*	.56*	.54*
Cooperation with supervision	466	.59	.58*	.59*	.58*	.59*
SARA						
Past assault of strangers/acquaintances	467	.52	.54*	.56*	.56*	.56*
Past violation of community supervision	467	.56	.56*	.58*	.59*	.60*
Recent relationship problems	467	.49	.52	.54*	.54*	.55*
Recent employment problems	467	.60	.61*	.61*	.62*	.63*
Recent substance abuse/dependence	467	.62*	.59*	.60*	.62*	.64*
Personality disorder with anger, impulsivity, or behavioural instability	467	.55	.50	.51	.51	.52*
Recent loss of social support network	467	.52	.51*	.51	.50	.50

Total prior occasions for technical offence	479	.62*	.65*	.66*	.66*	.67*
Total prior occasions for B&E	479	.61*	.55*	.56*	.56*	.57*

Some Take-Aways

The Central 8

WWJDS? (What would Jim and Don Say?)

Other Reflections

- Static/STABLE risk tools appear to be predicting sexual recidivism as intended
- SARA does not predict domestic violence recidivism any better than Static/STABLE
- Even well-established sexual recidivism risk factors didn't predict sex recidivism as well as in larger sample (unique subgroup?)
- IPV-specific risk factors tend to predict both sex and DV recidivism

Thoughts and Implications

- We love to classify into groups, subgroups, etc.....
- May be underestimating the universality of core risk factors for crime
- Individuals with both sexual and domestic violence offences seem to resemble generalists more than specialists
 - Intervention approaches should take this into account

Thank you for your time!
