# Quantum Technology Business Seminar

***Do you need a cat to understand how quantum computing works? A brief intro to the key concepts.***

**Invited Speaker: Dr. Khaled Mnymneh, NRC Canada**

9:00am-10:30am

Moderated by Stoyan Tanev & David Hudson

TIM Program, Sprott School of Business, Carleton University

# Technology Innovation Management Program (TIM)

## Sprott School of Business

Carleton University | Ottawa, Canada

Quantum Projects in TIM

Quantum Technology Workshops

Master Degrees Explore Quantum Business Opportunities

## Quantum Technologies for Business Seminars

*Explore Quantum Business Opportunities*

*by Sharing Knowledge/ Exchanging Ideas/ Engaging in Partnerships*

**Hosted by:** **Technology Innovation Management (TIM) Program, Sprott School of Business**, Carleton University at CU@Kanata, 350 Legget Drive, Suite 101

**Moderated by:** **Stoyan Tanev & David Hudson** (TIM/Sprott/Carleton); **Khaled Mnaymneh** (NRC); **Martin Laforest** (Quantacet); **Louise Davey** (LDIQ)

# Masters in TIM Pathways

## Master of Technology

MTECH is a project-based degree offers an opportunity for students to apply their technical knowledge to solve real-world problems

## Master of Applied Business Analytics

MABA is a project-based program that targets individuals who want to specialize in the application of advanced business analytics to solve technology problems

## Master of Entrepreneurship

MENT is a project-based program that focuses on improving the health of new companies or new lines of business

## Master of Science

MSc degree is thesis-based. Students undertake original research to address a highly relevant technology management issue under the supervision of an experienced faculty member

## Master of Digital Transformation & Entrepreneurship

MDTE is a project-based program that enables aspiring young professionals to acquire skills and competences needed to lead digital transformation initiatives

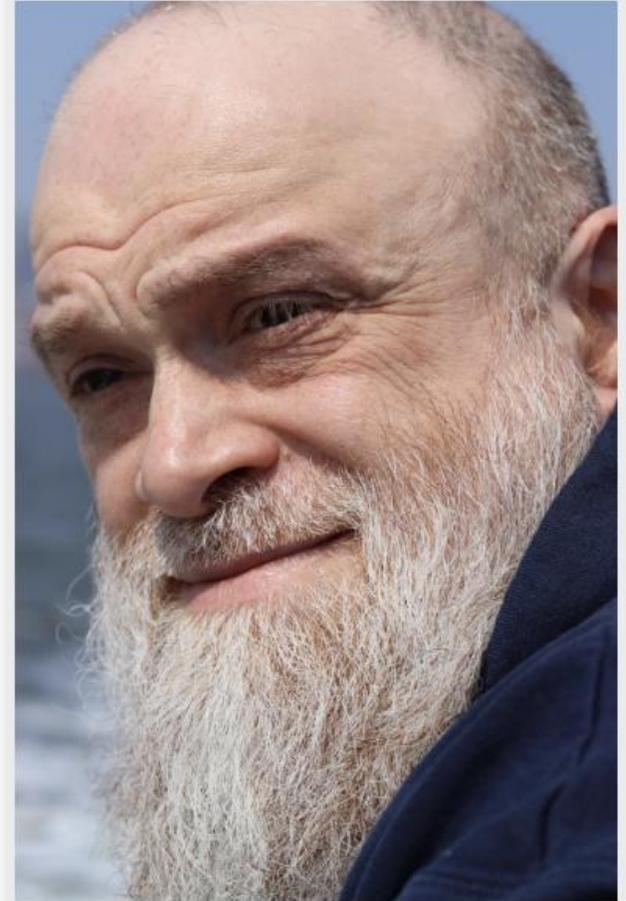

# Khaled Mnaymneh

## Roles and responsibilities

**Khaled Mnaymneh leads strategic quantum, nanotechnology, and advanced materials development for the Government of Canada.** His work spans foundational physics, device engineering, and national capability building. He drives research on quantum measurement, quantum-classical interfaces, nanofabrication, photonics, and semiconductor materials that enable next-generation sensors, networks, and information systems.

Khaled advises senior leadership on where Canada should invest, how to build sovereign capability in quantum and nanofabrication, and how to translate advanced materials research into practical technologies. He builds partnerships across academia, industry, and government, shaping programs that connect deep scientific insight to real-world platforms.

In the lab, he advances quantum devices, phononics, photonics, and nanoscale fabrication workflows, while mentoring researchers and developing new processes and infrastructure. He links fundamental science with actual technology development and helps guide NRC's national strategy in quantum and nanotech.

- the Church-Turing Thesis

## 3) What is quantum computing?

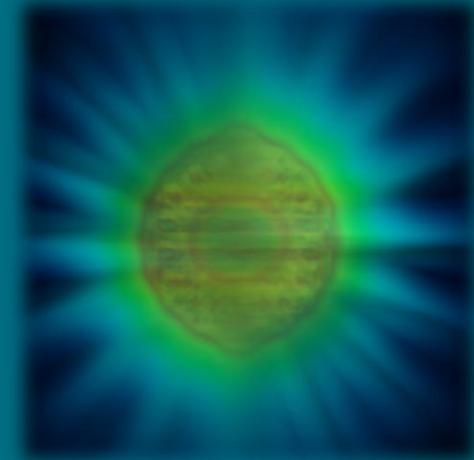

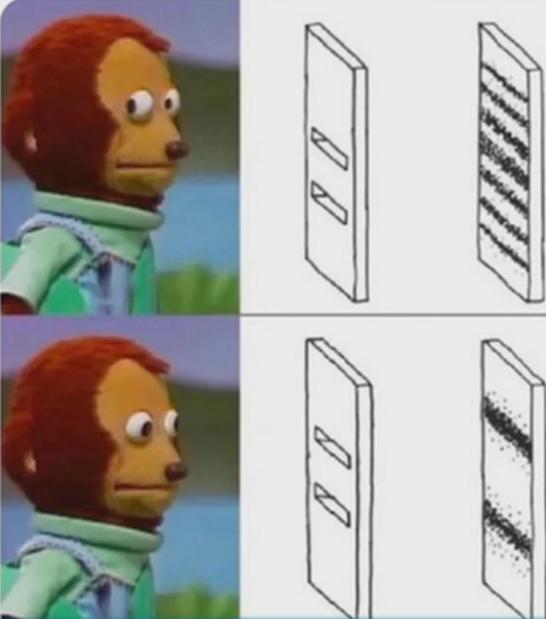

- the qubit
- teleportation
- BB84 (Charles Bennett and Gilles Brassard in 1984)

# What is quantum?

Prof. Feynman  @ProfFeynm... · 18h

If you think you understand quantum mechanics, you don't understand quantum mechanics.

# What is Quantum? – It's Atomic Physics

- it's what atoms do ...
- more importantly, is that the laws “down there” are “weird”
- like being Alice in Wonderland
- can we bring those laws back up to where we live and use them to process information?

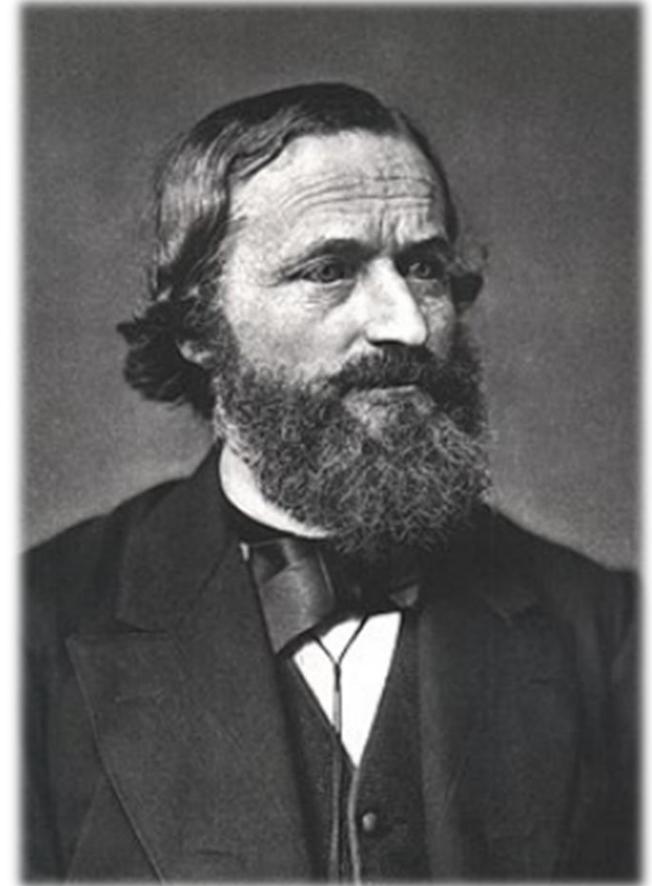

Atom

# What is Quantum? – It's blackbody radiation

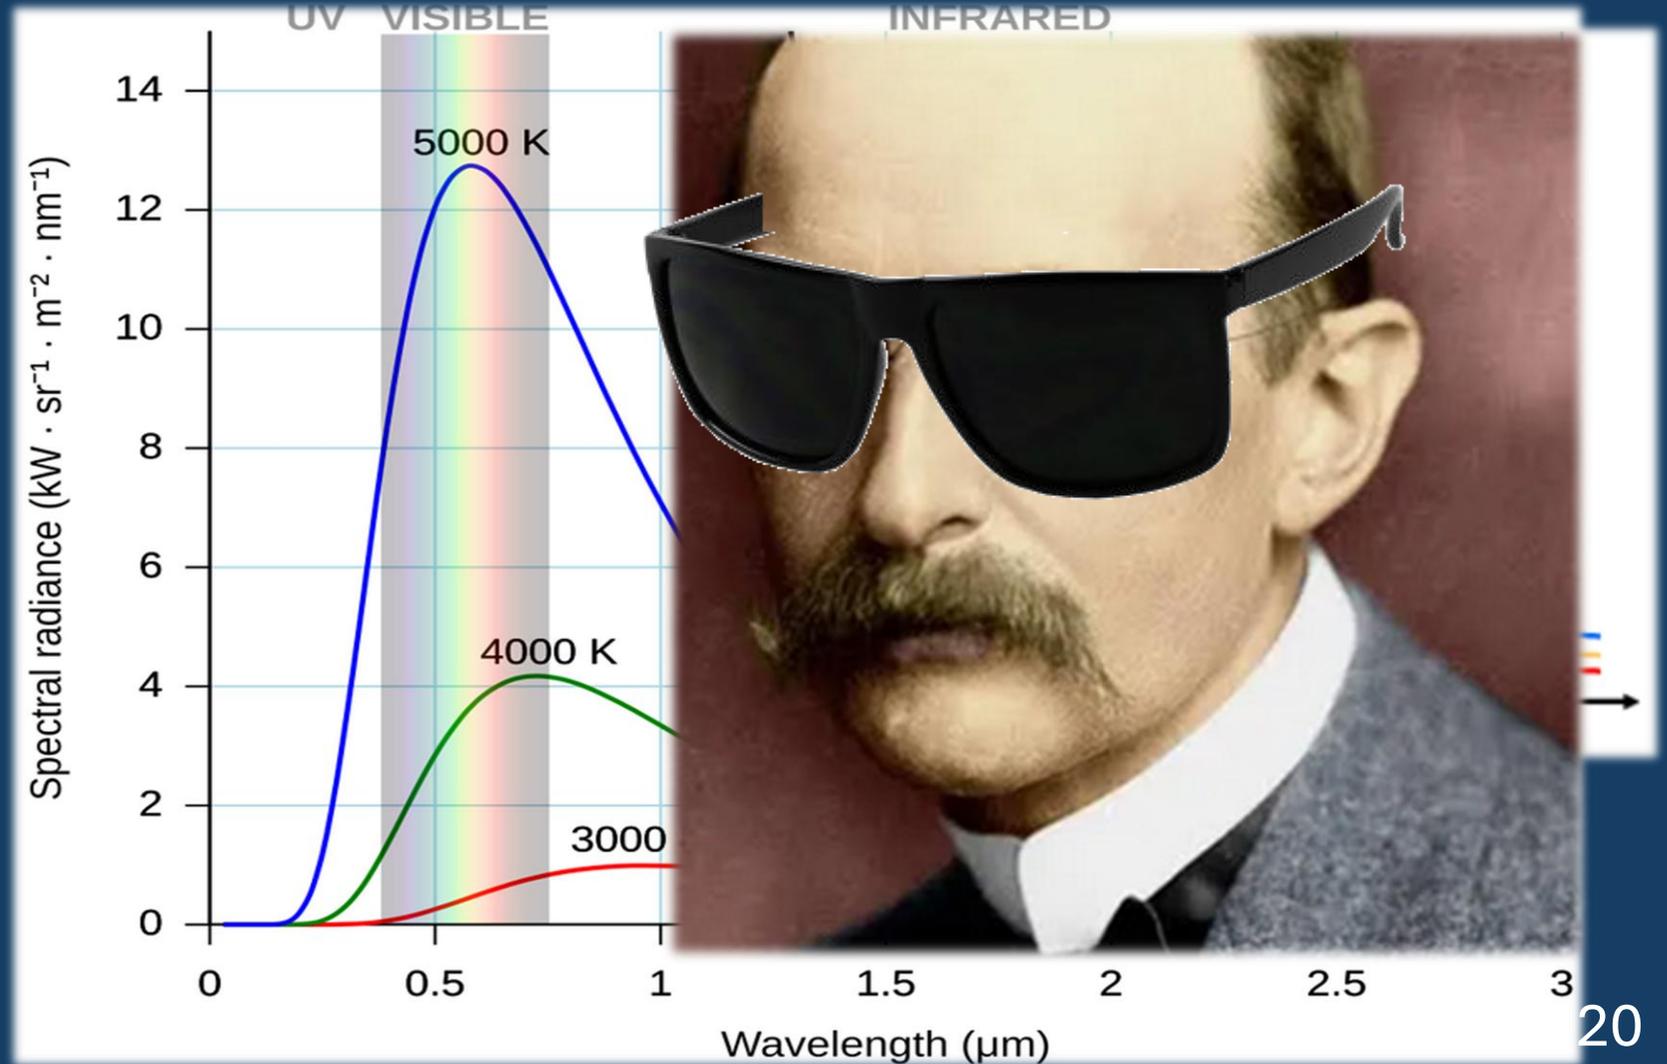

---

- how did “quantum” get kicked off ...
- it got Kirchhoff'ed! ... Gustav Robert Kirchhoff:
- he studied the **solar atmosphere**
- a property of all bodies and refers to the perfect emission and absorption of heat and light – blackbody radiation
- before we looked down, we looked up ... the sun
- this led to a **very very very very** important curve ...

# What is Quantum? – It's the Ultraviolet Catastrophe

- black body curve
- Wein's law
- very hard to derive it
- lead to the ultraviolet catastrophe
- problem until this guy came along ...

# What is Quantum? – It's Planck's Constant

---

- Planck couldn't derive that pesky “-1” in the denominator ...
- only when he assumed energy was not continuous but arrived in discrete packets did the math give him that “-1”
- the famous constant was born ...  
Planck's Constant ...

before  
quantum

$$E = \hbar \omega$$

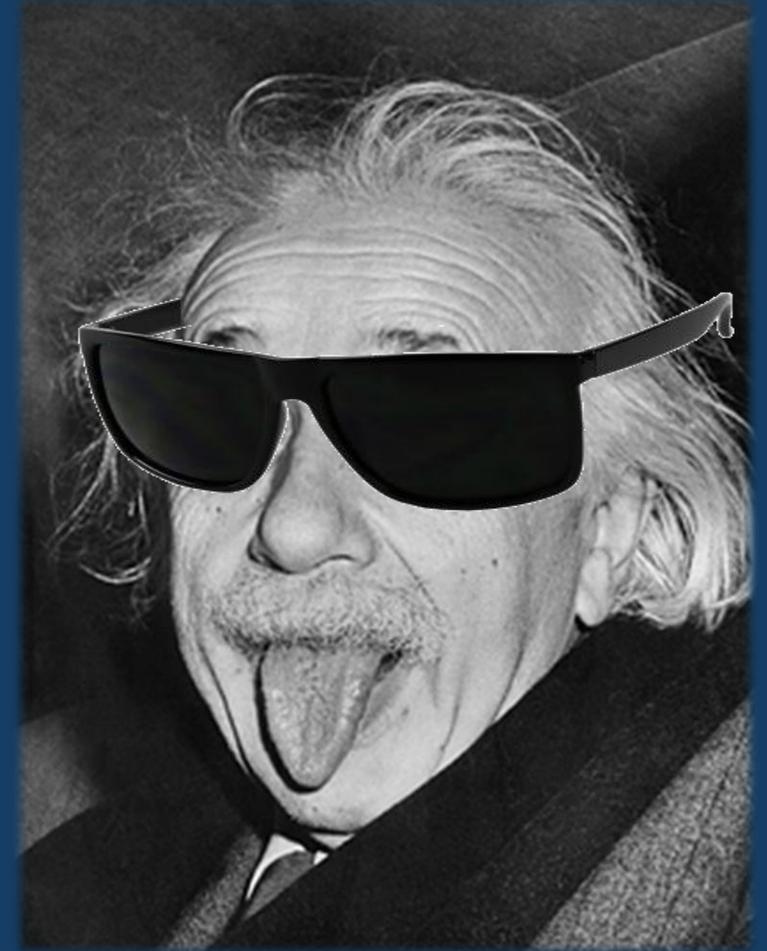

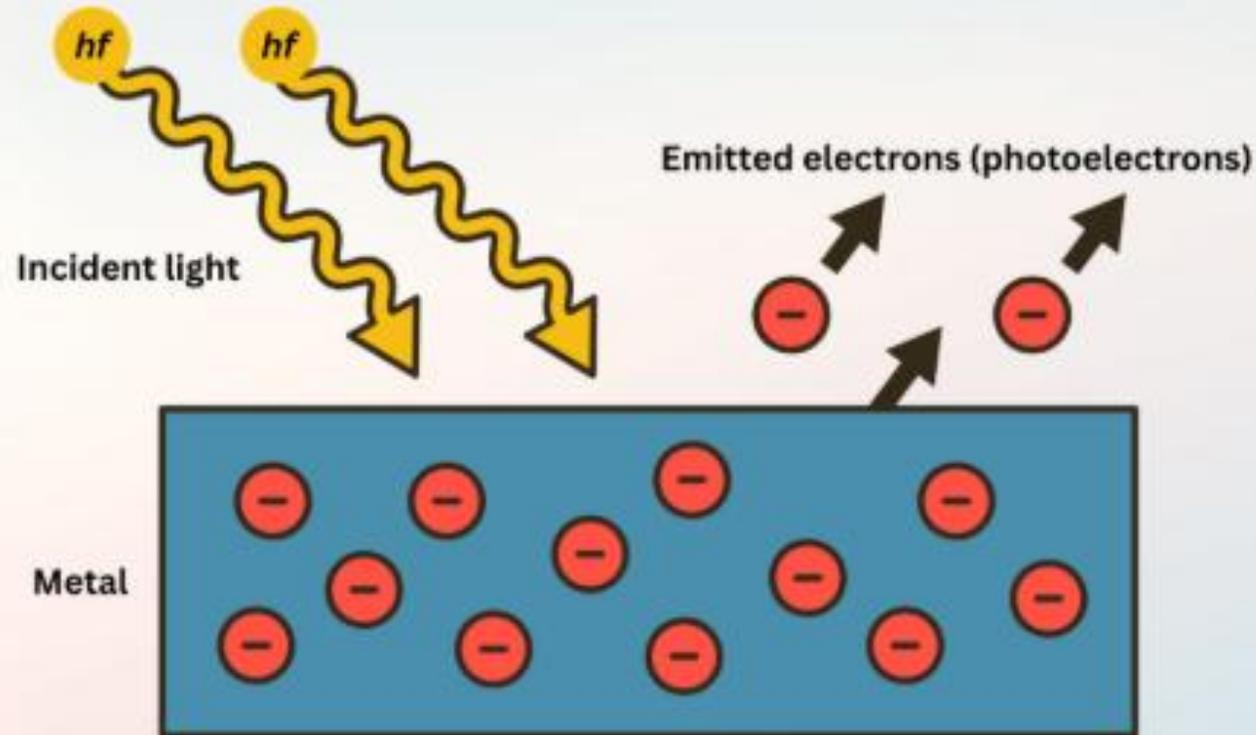

$$U = \frac{b}{\exp(1/a'T) - 1}$$

# What is Quantum? – It's the Photoelectric Effect

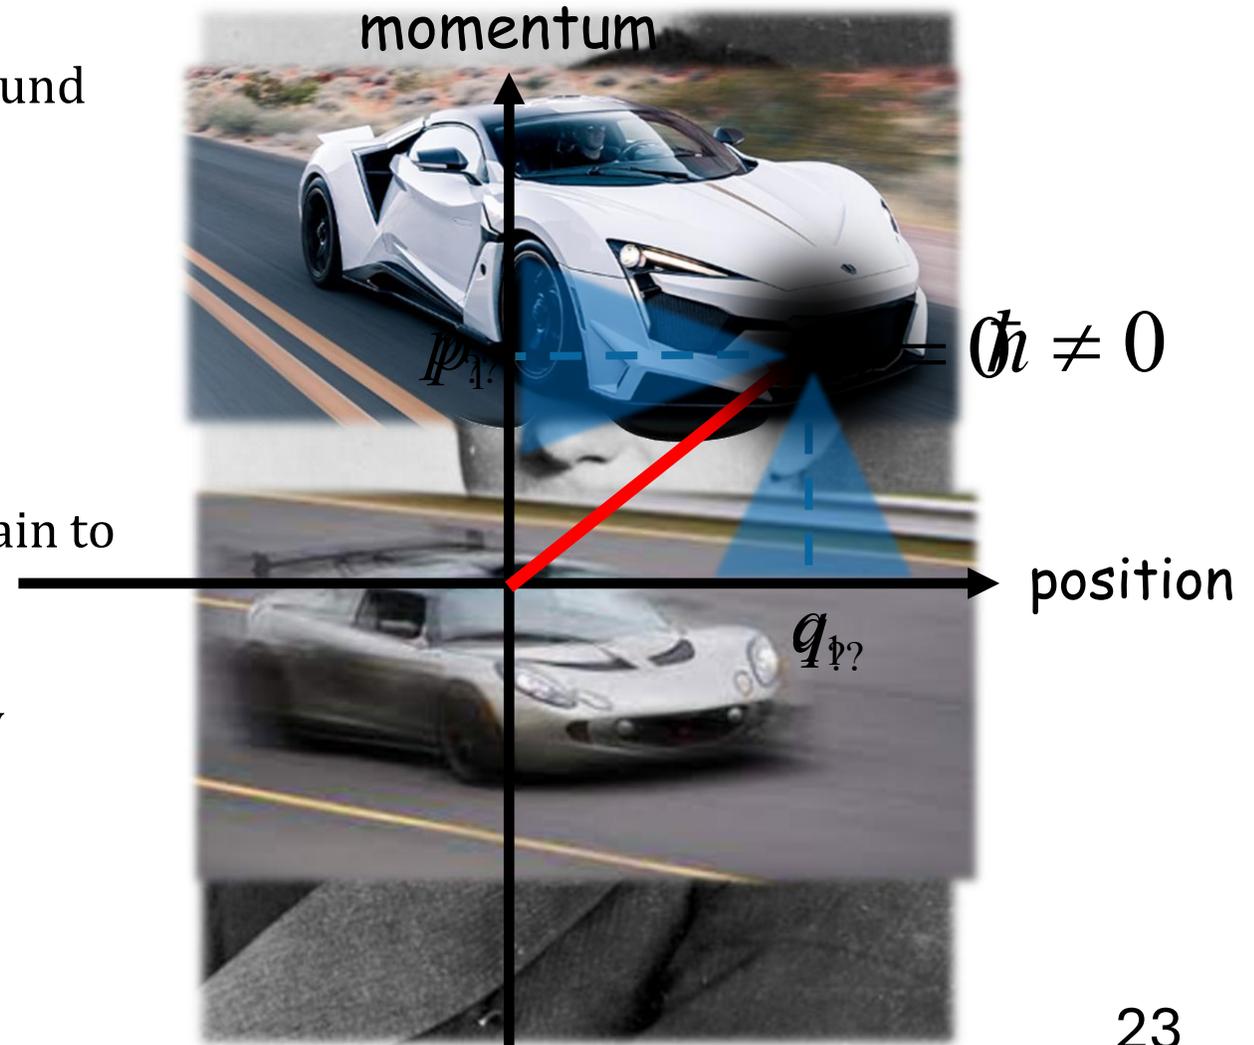

## Photoelectric Effect

The photoelectric effect is the emission of electrons from a material when it absorbs light of sufficient frequency.

# What is Quantum? – Heisenberg's Uncertainty Principle

- however, something was brewing in the background because of the discovery of Planck's constant
- its unit ...  
 $[h] = \text{energy} \times \text{time} = \text{momentum} \times \text{position}$
- it implied that reality was fundamentally uncertain to reality!
- this was the essence of Heisenberg's uncertainty principle
- he got the Nobel prize too ...

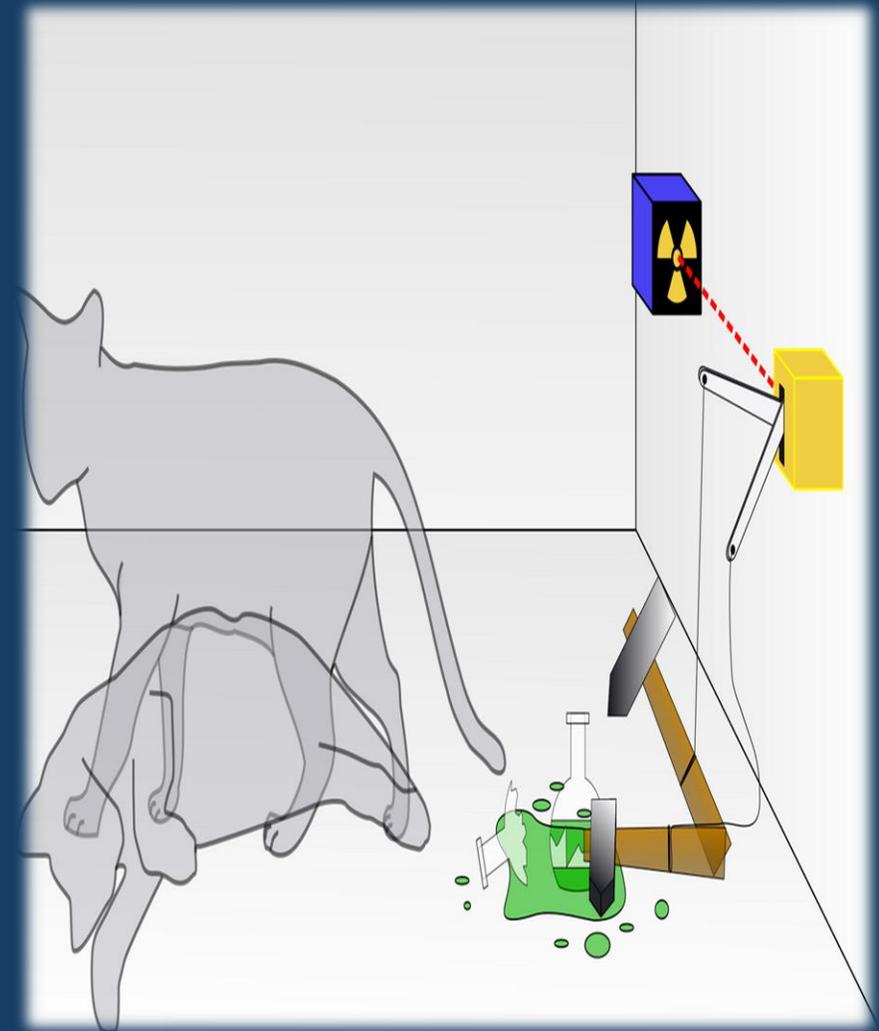

# What is Quantum? – It's Superposition

- Schrodinger tried to bring back a sense of determinacy with his wave mechanics
- however, atomic transitions were still seen to be fundamentally random:
- "If I had known that we were not going to get rid of this damned quantum-jumping, I never would have had anything to do with quantum theory!"
- this brings us to his cat ...

$$\frac{1}{\sqrt{2}}|\text{cat sitting}\rangle + \frac{1}{\sqrt{2}}|\text{cat running}\rangle$$

natural parallelism

# What is Quantum? – It's Randomness

---

- two extremely important concepts that contribute to quantum computing are:
  1. sum over histories – real, physical parallel processing – calculations with many worlds
  2. randomness ...
- in 1931, world-renowned mathematician John von Neumann proved that hidden variables do not exist
- this was the fly in Einstein's ointment ..

**MATHEMATICAL**

**By JOHN VON NEUMANN.**

# What is Quantum? – It's Entanglement

MAY 15, 1935

PHYSICAL REVIEW

VOLUME 47

## Can Quantum-Mechanical Description of Physical Reality Be Considered Complete?

A. EINSTEIN, B. PODOLSKY AND N. ROSEN, *Institute for Advanced Study, Princeton, New Jersey*

(Received March 25, 1935)

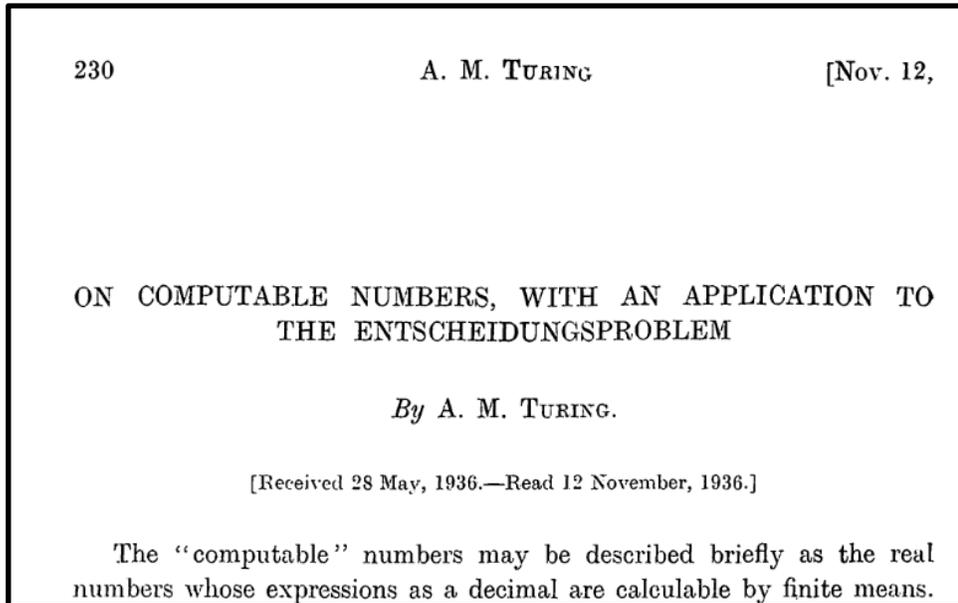

In a complete theory there is an element corresponding to each element of reality. A sufficient condition for the reality of a physical quantity is the possibility of predicting it with certainty, without disturbing the system. In quantum mechanics in the case of two physical quantities described by non-commuting operators, the knowledge of one precludes the knowledge of the other. Then either (1) the description of reality given by the wave function in

quantum mechanics is not complete or (2) these two quantities cannot have simultaneous reality. Consideration of the problem of making predictions concerning a system on the basis of measurements made on another system that had previously interacted with it leads to the result that if (1) is false then (2) is also false. One is thus led to conclude that the description of reality as given by a wave function is not complete.

- compelled Einstein to write his famous 1935 EPR paper
- while trying to disprove quantum theory as a complete theory, he inadvertently provided the basis for entanglement! (poor Einstein!)
- the third ingredient for quantum computing!

# What is Computing? – It's an entscheidungsproblem!

- first analog computer (2<sup>nd</sup> century BC)
- modern age ushered in by Alan Turing

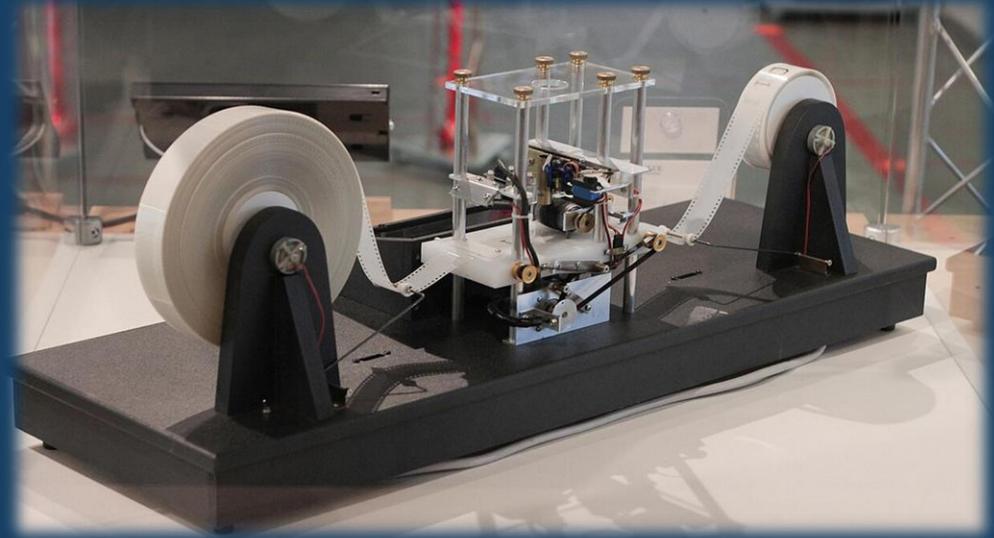

- entscheidungsproblem: an algorithm that takes any logical statement as input and correctly determines its validity in a finite number of steps

# What is Computing? – It's a Turing machine

- Turing developed an abstract notion of what we now call a programmable computer – model for computation known as the TURING MACHINE

- infinite strip of tape extending to the left and right, divided into little squares (cells)
- each square holds a symbol: 0, 1 or blank
- head: looks at one cell at a time;
  - it can: read the symbol OR write a symbol OR move left or right
- simple rule example: if you see a 1 and you're in state A -> write 0, move right and go to state B

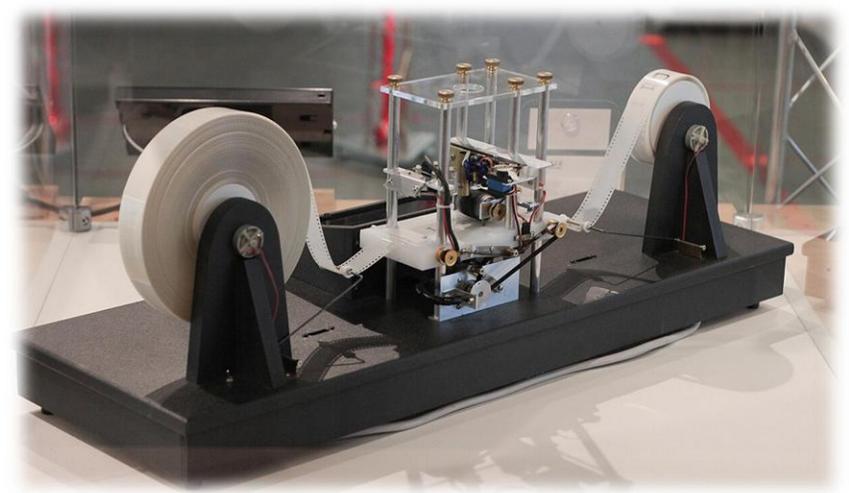

# What is Computing? – It's the Church-Turing Thesis

---

- Led to the Church-Turing thesis:

“any algorithmic process can be simulated efficiently using a Turing machine”

- but is this true?
- turns out analog computers can solve problems believed to have no solution on a Turing machine!
- however, noise kills this advantage

# What is Computing? – Randomized algorithm?!

- this means effect of noise must be taken into account in evaluating efficiency!
- but wait ... we have a new challenger to the Church-Turing thesis
- the randomized algorithm (Robert Solovay and Volker Stessen – mid-1970s)
- Solovay-Stessen test for primeness used randomness as an essential part of the algorithm!
- no deterministic test is known to do this ...

# What is Quantum Computing?

---

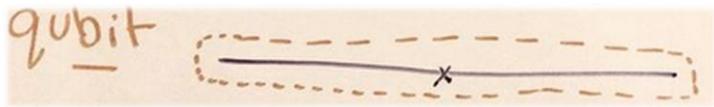

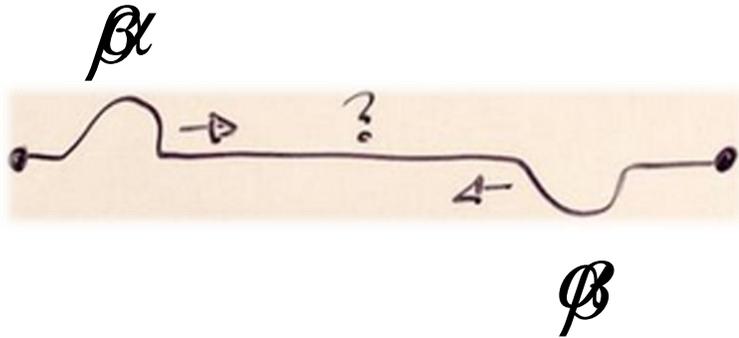

- challenge appears to be easily resolved by simply modifying the Church-Turing thesis:
  - “any algorithmic process can be simulated efficiently using a probabilistic Turing machine”
- really? we gonna keep doing this?
- no
- maybe ...
- the birth of quantum computing
- in 1985, David Deutsch asked whether the laws of physics could be used to derive an even stronger version of the Church-Turing thesis
- because the laws of physics are ultimately quantum mechanical, Deutsch was naturally led to consider computing devices based upon the principle of quantum mechanics

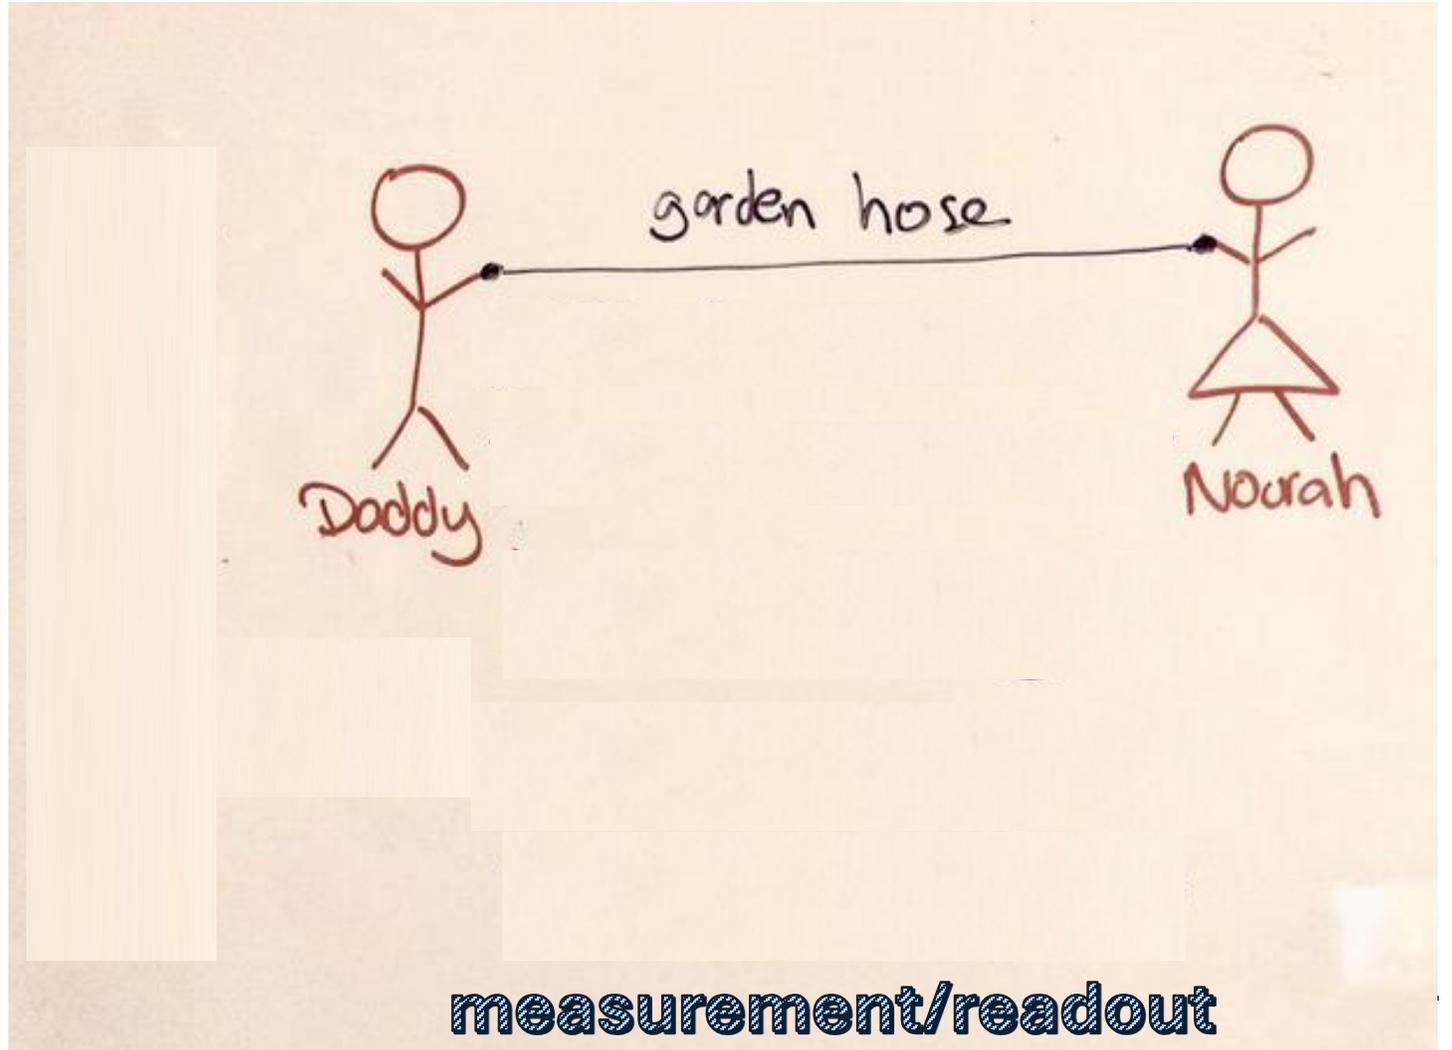

# What is Quantum Computing? – It's qubits!

- the qubit ...

$$|\psi\rangle = \alpha|0\rangle + \beta|1\rangle$$

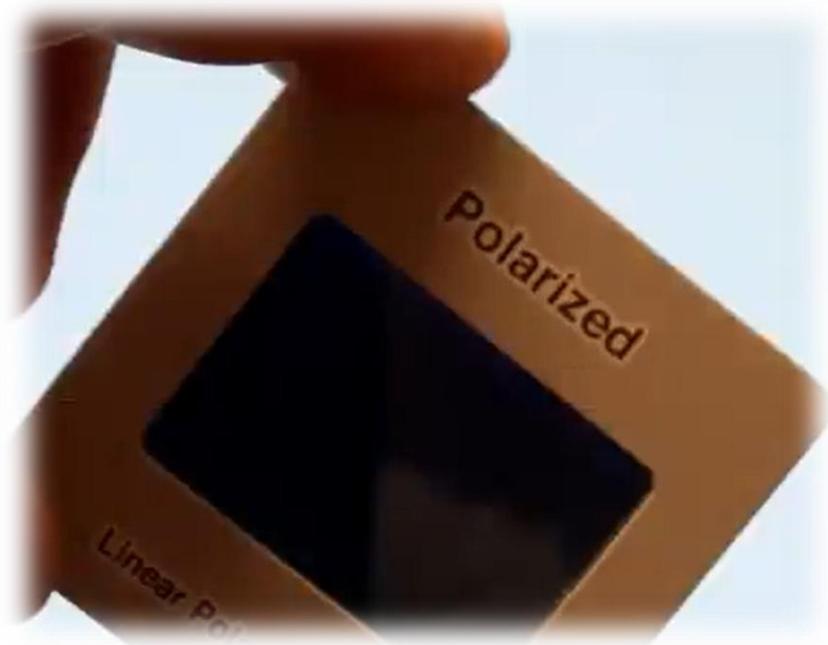

$$X \equiv \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}. \quad X \begin{bmatrix} \alpha \\ \beta \end{bmatrix} = \begin{bmatrix} \beta \\ \alpha \end{bmatrix}.$$

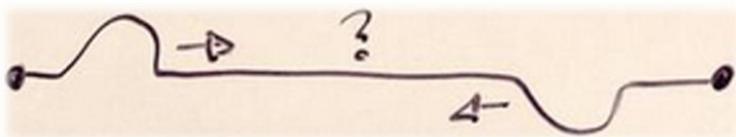

# What is Quantum Computing? – It's qubit manipulation

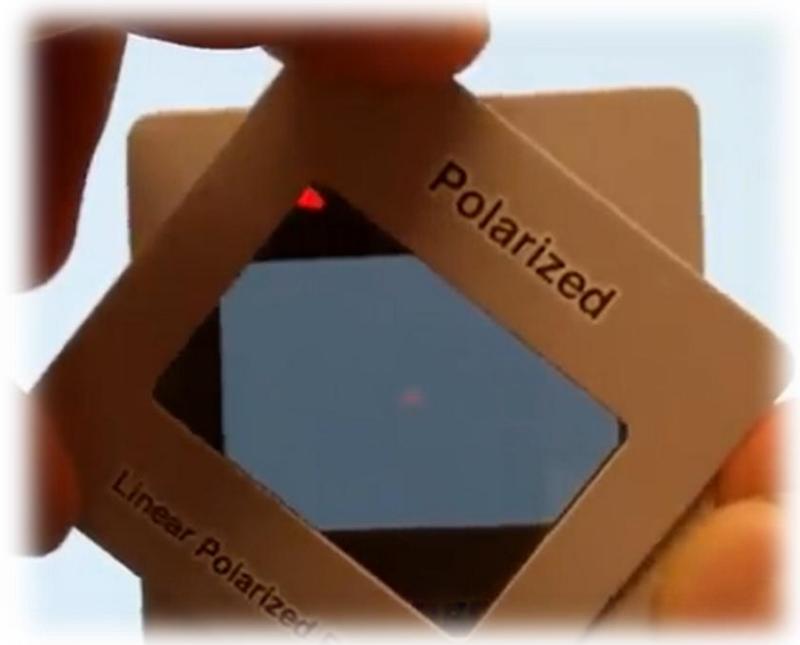

---

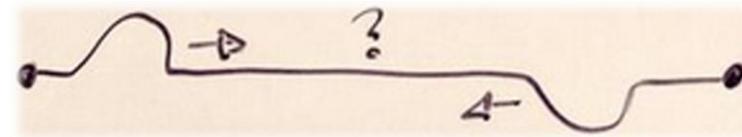

$\alpha$

$\beta$

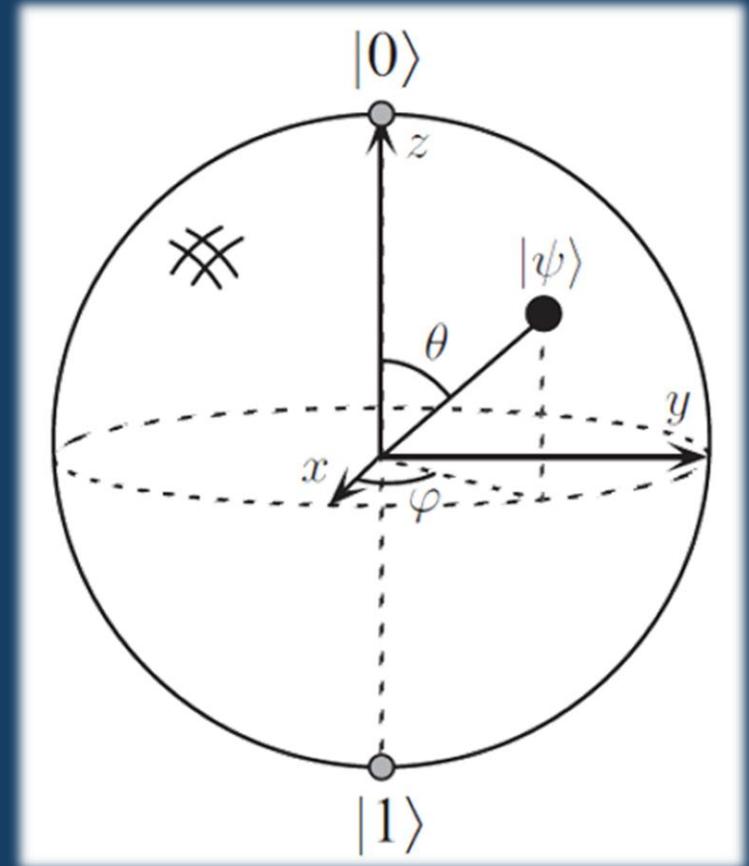

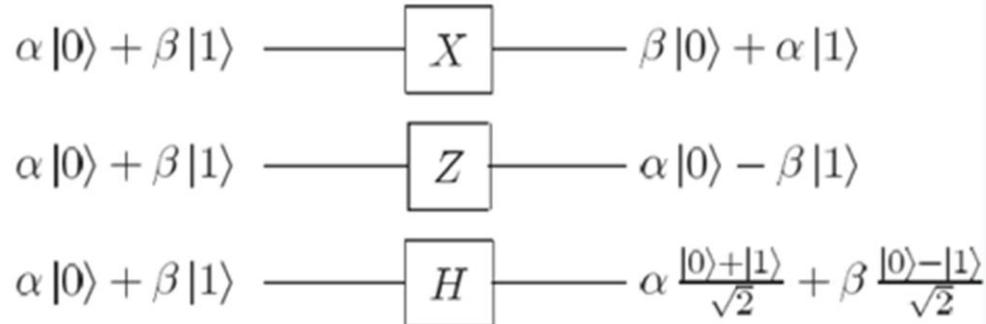

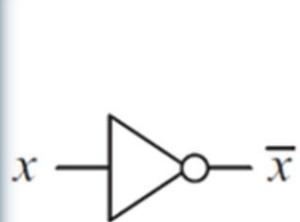

$\beta$

$\alpha$

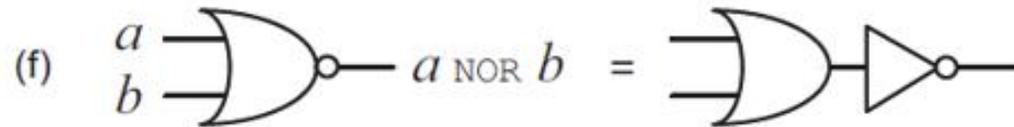

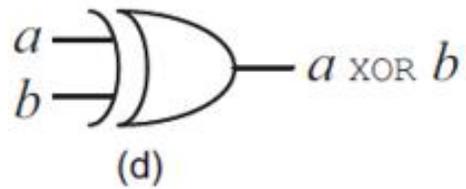

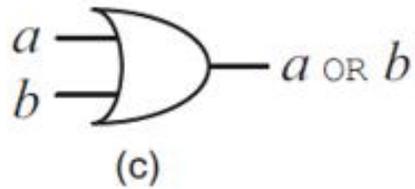

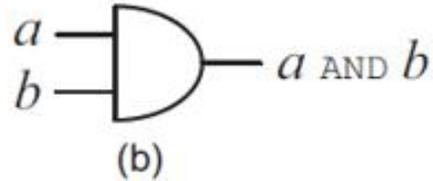

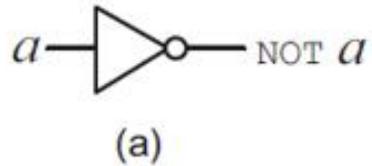

# What is Quantum Computing? – Qubit operations

- the Bloch sphere ...
- easy way to follow manipulations of the state via “gates”

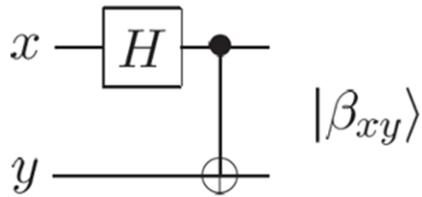

# What is Quantum Computing? – It's entangling

...

# What is Quantum Computing? – Bell states!

- Bell states

In	Out
$ 00\rangle$	$( 00\rangle +  11\rangle)/\sqrt{2} \equiv  \beta_{00}\rangle$
$ 01\rangle$	$( 01\rangle +  10\rangle)/\sqrt{2} \equiv  \beta_{01}\rangle$
$ 10\rangle$	$( 00\rangle -  11\rangle)/\sqrt{2} \equiv  \beta_{10}\rangle$
$ 11\rangle$	$( 01\rangle -  10\rangle)/\sqrt{2} \equiv  \beta_{11}\rangle$

## Can Quantum-Mechanical Description of Physical Reality Be Considered Complete?

A. EINSTEIN, B. PODOLSKY AND N. ROSEN, *Institute for Advanced Study, Princeton, New Jersey*

(Received March 25, 1935)

In a complete theory there is an element corresponding to each element of reality. A sufficient condition for the reality of a physical quantity is the possibility of predicting it with certainty, without disturbing the system. In quantum mechanics in the case of two physical quantities described by non-commuting operators, the knowledge of one precludes the knowledge of the other. Then either (1) the description of reality given by the wave function in

quantum mechanics is not complete or (2) these two quantities cannot have simultaneous reality. Consideration of the problem of making predictions concerning a system on the basis of measurements made on another system that had previously interacted with it leads to the result that if (1) is false then (2) is also false. One is thus led to conclude that the description of reality as given by a wave function is not complete.

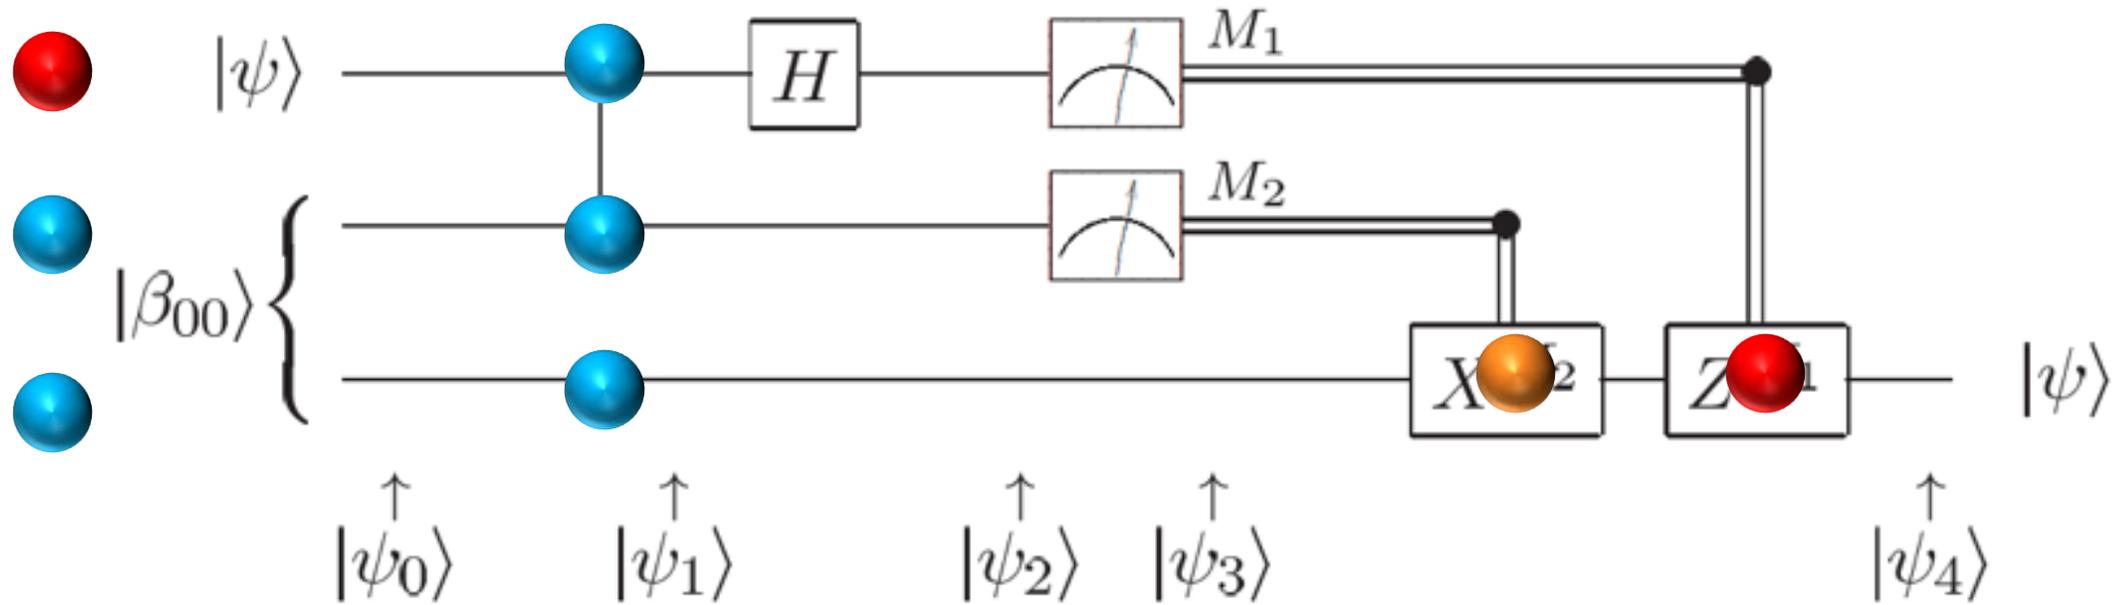

## ON THE EINSTEIN PODOLSKY ROSEN PARADOX\*

J. S. BELL†

*Department of Physics, University of Wisconsin, Madison, Wisconsin*

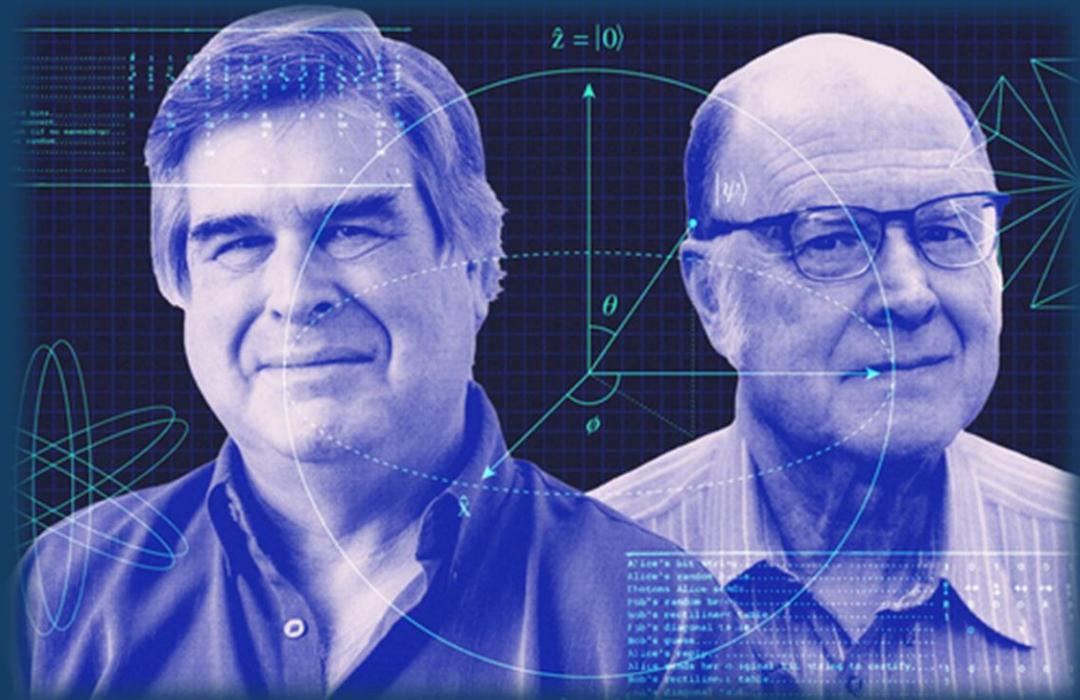

(Received 4 November 1964)

# What is Quantum Computing? – It's teleportation

# What is Quantum Computing? – BB84

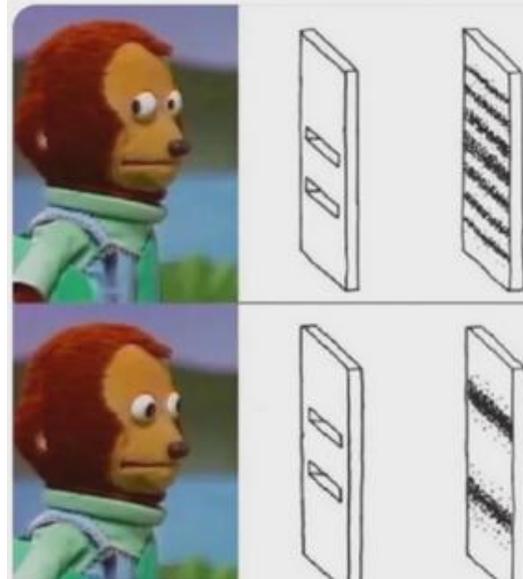

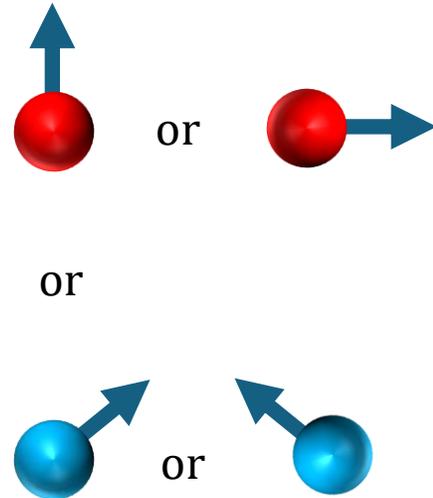

- in 1984 Gilles Brassard (a Canadian – yay!) and Charles Bennet showed that security need not rely on computational assumptions, but can instead be enforced by the structure of physical law itself
- they were award the Turing Award (the Nobel of Computer Science)
- what is BB84?

# What is Quantum Computing? – Nature hacking us ...

ALICE

or

BOB

- Alice and Bob publicly announce the bases they used to observe which photon
- They keep only the cases (where their bases matched) can't observe without changing the state
- Alice gives Bob a key stream of fully encrypted data different than from when she's not - abort

# Conclusions – Take away of key concepts

---

- superpositions – ability to process different “realities” at once
- randomness – key to solving problems more efficiently
- entanglement – access to manipulations that are independent of space and time
- elegant physics
- but daunting (but worthwhile) engineering
- business case – win-win ...
- so is a cat necessary?
- Absolutely!

# Is everything you heard today correct?
