INTRODUCTION

In Quaternary samples from the Rio Grande Rise in the southwest Atlantic Ocean, a benthic agglutinated foraminiferal species occurs that has also been observed in other medium to deep-water Atlantic (Cushman, 1922), Gulf of Mexico (Flint, 1897), Indian Ocean (Boltovskoy, 1978) and Pacific (Taylor, in preparation) localities. It has been variously referred to Gaudryina filiformis Berthelin, G. pseudofiliformis Cushman and G. bradyi Cushman. However, a careful examination of type illustrations indicates no affinity of the present specimens to these, or any other described species. Thus, a new species is required to accommodate these specimens.

MATERIALS

Materials used for this study were from the following localities:

1. Quaternary; DSDP Site 357 (Leg 39) on the Rio Grande Rise, southwest Atlantic Ocean; latitude 30° 00.25'S, longitude 35° 33.59'W. Core levels: core 1, Section 1, 82-92 cm; core 1, Section 2, 80-86 cm.

2. Recent; HMS Challenger, Station 24, off Culebra Island, north of St. Thomas Island, West Indies; depth, 720 meters.

METHODS

Thirty specimens from two localities were examined variously in reflected light, transmitted light, and with a scanning electron microscope to study the test surface, apertural form and position, and the test interior in whole and half longitudinal, and cross sections. For sectioning, specimens were embedded in Lakeside 70 and carefully ground on 15-micron wet/dry emery paper until the inner structure of the test was exposed. The specimens were then immersed in alcohol overnight to dissolve the Lakeside 70, mounted on a plug, coated with gold, and illustrated with a scanning electron microscope. Two specimens were etched at the base to show early chamber arrangement using the method described by Plummer (1951).

Scanning electron micrographs of some of the sectioned, etched, and other selected specimens were taken with an ISI Super-111A Scanning Electron Microscope using Polaroid NP 55 film.

TYPE SPECIMENS

The figured holotype, figured paratypes, and unfigured paratypes are deposited in the United States National Museum, Washington, D. C.

ACKNOWLEDGMENTS

This research was supported by a Canadian Natural Sciences and Engineering Research Council Postgraduate Scholarship, and a Joseph A. Cushman Student Research Grant. The Department of Earth and Space Sciences, University of California, Los Angeles, provided funds for the purchase of polaroid film. Samples from the Deep Sea Drilling Project were supplied through the assistance of the National Science Foundation. NSF Grant EAR-8306170 to Alfred R. Loeblich, Jr. and Helen Tappan provided support and use of the scanning electron microscope. I would also like to thank Dr. Loeblich for the specimens from the HMS Challenger sample and for assistance in preparing sections, and Dr. Tappan for critically reviewing the manuscript.

SYSTEMATIC DESCRIPTION

Suborder TEXTULARIINA
Delage and Herouard, 1896
Superfamily ATAXOPHRAGMIACEA
Schwager, 1877
Family EGGERELLIDAE Cushman, 1937
Subfamily EGGERELLINAE Cushman, 1937
Genus Karreriella Cushman, 1933
KARRERIELLA OBTURACULOIDES n.sp.
Plate 1, Figures 1-8
Gaudryina filiformis Berthelin, FLINT, 1899, p. 287, pl. 33, fig. 2 (non G. filiformis BERTHELIN. 1880, p. 25, pl. 1, fig. 8).
Gaudryina pseudofiliformis Cushman. CUSHMAN, 1922, p. 78, pl. 13, fig. 5 (non Gaudryina pseudofiliformis CUSHMAN, 1911, p. 70, fig. 3).

Karreriella bradyi (Cushman). BOLTOVSKOY, 1978, p. 162, pl. 4, figs. 28, 29 (non Gaudryina bradyi CUSHMAN, 1911, p. 67, fig. 107).

Diagnosis: A species of Karreriella with an elongate, minimally tapering test, and sutures perpendicular to the longitudinal axis.

Description: Test free, elongate, megalospheric specimens initially triserial and circular in section, later becoming biserial and slightly compressed; microspheric specimens with five globular chambers in the initial whorl, then becoming triserial, and rounded in section, finally biserial and compressed in the later stage; sutures slightly to moderately incised, perpendicular to the longitudinal axis; wall thick and finely agglutinated, distinctly canaliculate, with fine internal pores terminating beneath the test surface; aperture a straight slit, parallel to and slightly above the inner margin of the final chamber, may be bordered by a slightly raised lip.

Derivation of Name: From the Latin, *obturaclum*, n., stopper, plug, = -oides like, resembling, having the form of, with reference to the shape of the test.

Dimensions: Maximum length, 1500 microns; maximum width 400 microns.

Types and Occurrence: Oligocene to Recent. Holotype (USNM 383403), figured paratypes (USNM 383404), and unfigured paratypes (USNM 383405), all from DSDP Site 357 (Leg 39); Rio Grande Rise in the southwest Atlantic Ocean; latitude 30°00.25′S, longitude 30°33.51′W; Core 1, Section 1, 82-92 cm Quaternary. Figured paratype (USNM 383406) and unfigured paratype (USNM 383407), both from HMS Challenger Station 24, off Culebra Island, North of St. Thomas Island, West Indies; depth, 720 meters. The species also has been reported from Recent samples in the Gulf of Mexico, off the west coast of Cuba at 720 meters, in the Indian Ocean at 2237 meters and on the Lord Howe Rise in the Pacific Ocean at 1399 meters.

Remarks: In recent literature this species frequently has been referred to Gaudryina bradyi Cushman, which it superficially resembles. However, G. brady differs from the present species in tapering strongly toward the base and in the oblique sutures (approximately 25° to the longitudinal axis). Karreriella obturaculoides also has been referred to Gaudryina pseudofiliformis Cushman, but in addition to the radically different aperture, the latter species is also considerably more elongate and compressed than the present species. Gaudryina filiformis Berthelin is much smaller and more elongate than K. obturaculoides. Most of the specimens observed in this material were megalospheric specimens. As asexual megalospheric forms normally dominate foraminiferal

PLATE I

Karreriella obturaculoides, n. sp.

1,2. Side view of megalospheric holotype (USNM 383403). 1, view showing sutures perpendicular to longitudinal axis, X 130. 2, same enlarged to show slightly areal aperture parallel to inner margin of final chamber, X 225. DSDP Site 357, Core 1, Section 1, 82-92 cm.

3, Basal view of etched megalospheric paratype (USNM 383404) showing rounded section and triserial arrangement of some initial chambers, X 100. DSDP Site 357, Core 1, Section 1, 82-92 cm.

4,5. Oblique view of megalospheric paratype (USNM 383404). 4, specimen showing rounded base, becoming slightly compressed in later chambers, X 100. 5, enlargement of areal aperture, showing partly developed aperturallips, X 485, DSDP Site 357, Core 1, Section 1, 82-92 cm.

6. Half section of megalospheric paratype (USNM 383404), showing thickened walls of specimen and chamber arrangement near proloculus, X 65. DSDP Site 357, Core 1, Section 1, 82-92 cm.

7. Edge view of megalospheric paratype (USNM 383404) showing slightly compressed test and depressed sutures, X 50. DSDP Site 357, Core 1, Section 1, 82-92 cm.

8. Side view of microspheric para type (USNM 383406) showing the characteristic small proloculus, X 115, HMS Challenger Station 24, off Culebra Island, West Indies, depth 720 meters.
PLATE 1
populations the scarcity of microspheric forms in these relatively small samples is not remarkable.
